Make this Section a part of the Standard Specifications: 1 2 3 **"SECTION 510 – SCOUR PROTECTION AND REVETMENT** 4 5 6 510a – CLASS VII RIPRAP ROCK ARMOR STONE, 7 510b – CLASS III PARTIALLY GROUTED RIPRAP, 8 510c – CORE LAYER 9 510d – ROCK FILLER MATERIAL (KYOWA BAGS) 510e – ROCK FILLER MATERIAL (TRITON MARINE MATTRESS) 10 11 510f – KYOWA BAGS **510g – TRITON MARINE MATTRESS** 12 13 14 510.01 **Description.** This section describes the scour protection and revetment 15 design that will be used along the north and south embankments. A combination of foundation material, Class VII riprap armor stones, Class II partially grouted riprap, 16 17 and a core layer (as needed) will be installed. Kyowa Bags (or approved equal) and Triton Marine Mattress (or approved equal) will be installed as the foundation 18 material. The scour protection shall be installed to protect the embankments at the 19 20 north and south abutments from riverine scour during storms and along the south 21 shoreline to protect against oceanographic storm events and wave induced scour. 22 23 510.02 **Materials.** All rock material shall conform to the requirements of Material 24 Specification 523, Rock for Riprap and shall be obtained from designated sources. It shall be free from dirt, clay, sand, rock fines, and other material not meeting the 25 required gradation limits. 26 27 28 The contractor shall designate in writing the source from which rock material will be obtained and submit documentation for approval by the engineer that the material 29 30 meets contract requirements. Rock from approved sources shall be excavated, selected, and processed to meet the specified quality and grading requirements at 31 32 the time the rock is installed. 33 34 All stones shall have a minimum specific gravity of 2.40 and shaped midway between a sphere and a cube. 35 36 37 510.02a The Class VII Riprap Rock Armor Stones shall have the following minimum and maximum allowable particle sizes in inches 38 39 40

| Nominal Riprap Class by Median Particle Diameter | | d ₁₅ | | d ₅₀ | | d ₈₅ | | d ₁₀₀ | |
|---|-----------------|-----------------|-------------|-----------------|-------------|-----------------|-------------|------------------|--|
| <u>Class</u> | <u>Diameter</u> | <u>Min.</u> | <u>Max.</u> | <u>Min.</u> | <u>Max.</u> | <u>Min.</u> | <u>Max.</u> | <u>Max.</u> | |
| VII | 24 in. | 14.5 | 21.0 | 23.0 | 27.5 | 31.0 | 37.0 | 48.0 | |
| | | | | | | | | | |
| Nominal Riprap Class by Median Particle Weight | | W ₁₅ | | W ₅₀ | | W ₈₅ | | W ₁₀₀ | |
| <u>Class</u> | <u>Weight</u> | <u>Min.</u> | <u>Max.</u> | <u>Min.</u> | <u>Max.</u> | <u>Min.</u> | <u>Max.</u> | <u>Max.</u> | |
| VII | 1/2 ton | 260 | 740 | 950 | 1700 | 2500 | 4100 | 9000 | |

 510.02b The Class III Partially Grouted Riprap shall have the following minimum and maximum allowable particle sizes in inches

| Nominal Riprap Class by Median Particle Diameter | | d ₁₅ | | d ₅₀ | | d ₈₅ | | d ₁₀₀ | |
|---|-----------------|-----------------|-------------|-----------------|-------------|-----------------|-------------|------------------|--|
| <u>Class</u> | <u>Diameter</u> | <u>Min.</u> | <u>Max.</u> | <u>Min.</u> | Max. | <u>Min.</u> | <u>Max.</u> | <u>Max.</u> | |
| ш | 12 in. | 7.3 | 10.5 | 11.5 | 14.0 | 15.5 | 18.5 | 24.0 | |
| | | | | | | | | | |
| Nominal Riprap Class by Median Particle Weight | | W ₁₅ | | W ₅₀ | | W ₈₅ | | W ₁₀₀ | |
| <u>Class</u> | <u>Weight</u> | <u>Min.</u> | <u>Max.</u> | <u>Min.</u> | <u>Max.</u> | <u>Min.</u> | <u>Max.</u> | <u>Max.</u> | |
| ш | 150 lb | 32 | 93 | 120 | 210 | 310 | 510 | 1100 | |

Grout shall be composed of a Portland Cement based grout with a minimum 28-day compressive strength of 3000 PSI. See the recommended concrete mix ratio below for one cubic yard:

| Portland Cement Fine Aggregate (sand) | 740 to 760 lbs 1,180 to 1,200 lbs |
|--|--------------------------------------|
| 1/4" Crusher Chips (Gravel) | 1,180 to 1,200 lbs |
| Water | 420 to 450 lbs |
| Air Entrained | 5 to 7% |

Grout shall be placed by hand or using a hose or tremie method and shall not segregate when being applied. If using a hose or tremie method, ensure the

nozzle is sufficiently sized to fit into the void spaces for proper placement of

- 62 grout. Fill the voids between stones a depth of 1/3 of the total void space 63 thickness (1/3 the thickness of the riprap layer) as measured from the exterior 64 surface. Exterior grout surfaces shall be broom finished to maintain a smooth 65 exterior finish between stones.
- 67 **510.02c** The Core Layer shall be well graded with a maximum dimension
 68 of 6 inches (6-inch Minus).
 69
- 510.02d The Kyowa Bag Rock Filler Material shall be well graded with a
 maximum dimension of 6 inches and a minimum dimension of 3 inches. If
 using a different product, follow manufacturers recommendations for rock
 sizes.
- 510.02e The Triton Marine Mattress Rock Filler Material shall be well
 graded with a maximum dimension of 6 inches and a minimum dimension of 2
 inches. The average stone size shall not be greater than 4 inches. If using a
 different product, follow manufacturers recommendations for rock sizes.
- **510.02f** The Kyowa Bag (or approved equal) Material shall have the final fill dimensions of 6 feet diameter by 1.5 feet high. The netting material shall be capable of permanently encasing the filler rock, able to be lifted in place, suitable for use in a marine and riverine environment, and capable of withstanding water velocities of 10 ft/s.
- The Triton Marine Mattress (or approved equal) Material shall be 86 510.02g 87 made of High Density Polyethylene (HDPE) fabric material stitched into 88 rectangle shapes as shown on the plans with individual compartments that will 89 be filled with the filler stone. A geotextile fabric shall be incorporated along the 90 bottom surface with an overlapping flap that can placed under the adjacent 91 mattress for continuity. The mattresses shall be made according to the 92 dimensions showed, then filled with the filler stones and closed, then lifted 93 using a spreader bar and laid in place. The mattress shall be capable of 94 permanently encasing the filler rock, able to be lifted in place, used in a marine 95 and riverine environment, and suitable as a foundation layer for the Class VII 96 riprap armor stones.
- 97 98

66

510.03 Construction. The work shall consist of the construction of a stone revetment scour protection and shoreline protection, including Class VII riprap armor stones, Class III partially grouted riprap, geotextile fabric, and a core layer (if situated on soil and not hard material) which is additionally wrapped in a geotextile fabric. The Kyowa Bags (or approved equal) and the Triton Marine Mattress shall be used as the foundation material that the Class VII riprap will be place on.

- 105
- 106**510.03a**The Class VII riprap shall be placed by equipment to the depth107and height specified. It shall be installed to the full course thickness in one

108 operation and in such a manner as to avoid serious displacement of the 109 underlying material. The Class VII riprap shall be delivered and placed in a 110 manner that ensures the riprap in place is reasonably homogeneous with the 111 larger rocks uniformly distributed along the exterior surfaces and firmly in contact one to another with the smaller rocks laid in the interior of the 112 113 revetment. Spalls shall be used to fill the voids between the larger rocks. 114 Some hand placing may be required to provide a neat and uniform surface. 115 The Class VII riprap shall be placed in a manner to prevent damage to 116 structures. Hand placing is required as necessary to prevent damage to any 117 new and existing structures. 118

119 The Class III partially grouted riprap shall be placed by 510.03b equipment or by hand to the depth and height specified. It shall be installed to 120 the full course thickness in one operation and in such a manner as to avoid 121 122 serious displacement of the underlying material. The Class III riprap shall be delivered and placed in a manner that ensures the riprap in place is 123 124 reasonably homogeneous with the larger rocks uniformly distributed along the 125 exterior surfaces and firmly in contact one to another with the smaller rocks 126 laid in the interior of the revetment. Spalls shall be used to fill the voids 127 between the larger rocks. Once the stones are in place, the top 1/3 of the void spaces shall be grouted. Do not fully grout the all the void spaces. This 128 ensures that the Class III riprap will be "self-healing" if it becomes damaged or 129 undermined. The grout shall be composed of a Portland Cement base with a 130 131 minimum 28-day compressive strength of 3000 PSI.

133**510.03f**The Kyowa Bags (or approved equal) shall be filled by the
means and methods specified by the manufacturer. It shall also be filled to
recommended weight using the specified rock material. Once filled the bags
shall be lifted and installed as shown on the plans for lift 1 and lift 2.137

138**510.03g**The Triton Marine Mattress (or approved equal) shall be filled by139the means and methods specified by the manufacturer. It shall also be filled140to recommended weight using the specified rock material. Once filled the141mattresses shall be lifted and installed as shown on the plans

142

132

A geotextile fabric shall be placed under the Class VII and Class III riprap and on the
 prepared subgrade surface as specified. Compaction of filter or bedding aggregate is
 not required, but the surface of such material shall be finished reasonably smooth
 and free of mounds, dips, or windrows.

147

See the plans for specific locations.

- 150 **Submittals.**
- 151(A) Submit (6) sets of material gradation for the Class VII Riprap Armor152Stone, the Class III Partially Grouted Riprap, the Core Layer, the Filler153Rock for the Kyowa Bags and the Triton Marine Mattress for approval by
