24		
25	(A) Submittals.	
26 27	(1) At least 14 days prior to the mass concrete pour, submit a The	ormal
27 28	Control Plan prepared by a specialty Engineer with at least 5 year	
29	experience in the design and temperature control of mass concre	
30	The plan shall follow ACI 207.1R "Guide to Mass Concrete" and a	
31	address the following issues:	
32	S .	
33	(a) An analysis of anticipated thermal developments within	the
34	mass pour placements using proposed materials and casti	
35	methods. List locations of anticipated mass concrete pours	3,
36	type of structure, and anticipated volume of concrete	
37		
38	(b) A plan which includes mix design, insulation and coolir	ıg
39	outlining specific measures to be taken to control the	
40	temperature differential and the maximum temperature	
41 42	(c) The proposed monitoring system	
42 43	(b) The proposed monitoring system	
44	(d) Duration and method of curing	
45	(a, = aaaa. a. a. a. a. a. a. a.	

- **(e)** An outline of corrective actions to maintain the temperature differential and the maximum temperature to avoid cracking
- **(e)** Proposed methods of repairs or corrective actions if the mass concrete member is not accepted as well as preventative measures to ensure issues do not reoccur
- (2) Drilled shaft concrete heat of hydration development shall be addressed independently from the Thermal Control Plan considering ambient ground conditions and range of expected placement temperatures to ensure conformance with the maximum temperature limit and gradients set forth herein.
- **(B) Quality Control.** Mass Concrete production requires Contractor responsibility for quality control of materials during handling, blending, mixing, curing, and placement operations.

Sample, test, and inspect concrete to ensure quality control of component materials and concrete. Sampling and testing for quality control in accordance with standard methods shall be performed by certified ACI Concrete Field Technician Grade I. Perform quality control tests for slump, air content, temperature, and unit weight during production of mass concrete other than concrete for incidental construction. Submit quality control test results.

Cease all mass placement operations and revise the Thermal Control Plan as necessary if either the maximum core temperature or maximum differential temperature is exceeded.

If any mass concrete placed under these Specifications proves unsatisfactory, the Contractor will be required to make the necessary repairs or to remove and replace the material at the Contractor's expense.

The Engineer will be the sole judge in determining the acceptance of a mass concrete member. Corrective actions, as approved in the Thermal Curing Plan Report, shall be made in those areas directed by the Engineer before the mass concrete member will be considered for acceptance.

(C) Mix Design. The specialty Engineer shall select the concrete mix proportions that will generate the lowest maximum temperature possible to ensure that no Delayed Ettringite Formation (DEF) will occur and also the lowest temperature differential to ensure there will be no thermal cracking. Mass concrete shall conform to the provisions in Section 601 – Structural Concrete with the following exceptions:

91	(1) Select concrete ingredients, e.g., aggregates, gradation,
92	admixtures, and cement types that minimize the heat of hydration.
93	
94	(2) Cementitious Material: Mass concrete shall contain a minimum of
95	505 pounds of cementitious material per cubic yard of concrete. To
96	better control the heat of hydration of the mass concrete, the concrete
97	mix design shall contain a pozzolanic material such as fly ash, silica
98	fume, or ground granulated blast furnace slag (GGBFS). GGBFS shall
99	be compliance with ASTM C989. The minimum amount of fly ash or
100	natural pozzolan shall be the weight of the total amount of cementitious
101	material.
102	(a) When aumplementary comentitious (CCM) metarial is
103 104	(a) When supplementary cementitious (SCM) material is GGBFS, the amount of SCM shall be 50 to 75 percent by weight
104	of the total cementitious material used in the mix. When the
106	SCM is not GGBFS, the SCM content shall be from 25 to 35
100	percent by weight of the total cementitious material used in the
107	mix.
108	THA.
110	(3) Temperature Sensing Equipment: Use thermistor-type
111	temperature-sensing devices or an approved equal capable of
112	indicating temperatures over a range of 50 to 200 degrees Fahrenheit,
113	with an accuracy and precision of ±1 degree Fahrenheit. Connect the
114	sensors to a device that continuously records and displays
115	temperatures and produces a record that can be detached and filed.
116	
117	(D) Monitoring and Controlling Temperature.
118	
119	(1) Thermally cure the concrete in order to maintain a temperature
120	differential between the internal (hottest: located as close as possible
121	to the center of the pour but not less than 12 inches from the surface)
122	and external (coolest temperature of the concrete) of 35 degrees
123	Fahrenheit maximum. In addition, the internal temperature of the
124	concrete (measured at the hottest point located at the center of the
125	pour) shall at no time exceed 160 degrees Fahrenheit.
126	(2) I lead a complimation of the following alements to the graph live cure the
127	(2) Use a combination of the following elements to thermally cure the
128	concrete to maintain internal and differential temperature:
129	(a) Use of shaved, flaked, or chipped ice or other concrete
130 131	cooling ingredients
132	cooling ingredients
133	(b) Use of liquid nitrogen dosing systems
134	(b) Coc of liquid filtrogett dosting systems
135	(c) Controlling the rate or time of concrete placement
136	(5) Tallianing and tale of anio of controlled placement

137	(d) Using insulation or supplemental external heat to control
138	heat loss
139	(a) Hoing aupplementary compating materials or additives that
140	(e) Using supplementary cementing materials or additives that
141	will reduce heat of hydration without affecting strength or
142	durability
143	(f) I laine a machanical applies aveters
144	(f) Using a mechanical cooling system
145	(a) Heigh a cooling system to control the core temporature
146	(g) Using a cooling system to control the core temperature
147	(b) Other methods accomted by the Franciscon
148	(h) Other methods accepted by the Engineer
149	(O) Describe to an exercise an existence of a consequence of the conse
150	(3) Provide temperature monitoring devices to record temperature
151	development between the interior and exterior of the element at points
152	approved by the Engineer, and shall monitor the mass pours to
153	measure temperature differentials. Temperature monitoring shall
154	continue until the interior temperature is within 35 degrees Fahrenheit
155	of the lowest ambient temperature, and when the interior temperature
156	has plateaued and is decreasing.
157	(a) For the control of the control o
158	(a) Furnish and install a temperature monitoring and recording
159	system. This system shall consist of temperature sensors and a
160	data acquisition system. Use these devices to simultaneously
161	measure and record the temperature of the concrete at the core
162	and the surface. The Engineer may adjust the locations for all
163	temperature sensors from those stated in the Contractor's
164	Thermal Control Plan.
165	(b) December to the set of many the second to be a set of many the second to be a second to be a second to be a
166	(b) Record each set of readings as they are taken and make a
167	temperature chart for each mass pour element showing
168	temperature readings vs. time. The temperature chart showing
169	temperature differential shall have both the interior temperature
170	and ambient temperatures on the same chart. Submit to the
171	Engineer the readings and chart. If the temperatures indicate
172	temperatures are trending toward non-compliant temperatures
173	immediately inform the Engineer and take action as presented
174	in the Thermal Control Plan. Record the temperature readings
175	hourly or more frequently. The Engineer may change the
176	recording frequency of the reading at any time.
177	
178	(c) Methods of concrete consolidation and placement shall
179	prevent damage to the temperature monitoring and recording
180	system. Wiring from temperature sensors cast into the concrete
181	shall be protected to prevent movement. Wire runs shall be
182	kept short as possible. The ends of the temperature sensors
	ED 00/004)

183	shall not come into contact with concrete form or with bar
184	reinforcing steel or casing.
185	
186	(4) If monitoring indicates that the proposed measures are not
187	controlling the concrete temperature differential within the 35 degrees
188	Fahrenheit specified, implement corrective actions as presented in the
189	Thermal Curing Plan to maintain the temperature differential.
190	
191	695.04 Measurement. The Engineer will measure mass concrete as concrete used
192	in other sections in accordance with that other applicable sections.
193	
194	695.05 Payment. The Engineer will pay for the accepted mass concrete as
195	concrete used in other sections as concrete under that other applicable sections."
196	
197
