1 2	Amend S	Section 401- HOT MIX ASPHALT (HMA) PAVEMENT to read a	as follows:
2 3 4		"SECTION 401 – HOT MIX ASPHALT (HMA) PAVEMENT	
4 5 6 7	401.01 HMA pav	Description. This section describes furnishing and placing der vement (herein referred to as HMA) on a prepared surface.	nse graded
7 8 9	401.02	Materials.	
10	Asphalt (Cement (PG 64-16)	702.01(A)
11 12	Use for r	non-surface mixes, unless otherwise specified in the project doc	uments.
13 14	Asphalt (Cement (PG 64E-22)	702.01(B)
15 16 17 18 19	specified	all surface mixes, except for on Lanai and Molokai, and unless I in the project documents. Polymer modified asphalt (PMA) asphalt mix using PG 64E-22, unless otherwise indicated.	
20 21	Emulsifie	ed Asphalt	702.04
21 22 23	Warm Mi	ix Asphalt Additive	702.06
24	Aggregat	te for Hot Mix Asphalt Pavement	703.09
25 26 27	Filler		703.15
27 28 20	Hydrated	Lime or a liquid anti-strip approved by the engineer	712.03
29 30 31 32 33		A) General. HMA pavement shall be plant mixed and sh ixture of aggregate and asphalt binder and may include reclaim avement (RAP) or filler, or both.	
34 35 36 37		The manufacture of HMA may include warm mix asph rocesses in accordance with these specifications. WMA process ombinations of organic additives, chemical additives, and foamin	ses include
38 39 40 41		HMA pavement shall include surface course and may inclusion ore binder courses, depending on HMA pavement thickness in e contract documents.	
42 43 44 45 46	pe m	RAP is defined as removed or reprocessed pavement ontaining asphalt and aggregates. Process RAP by crushing ercent of RAP passes 3/4-inch sieve. Size, grade uniformly, an aterials such that blend of RAP and aggregate material conforms equirements of Subsection 703.09 - Aggregate for Hot M	g until 100 id combine s to grading

47 Pavement.

In surface and binder courses, aggregate for HMA may include RAP quantities up to 20 percent of total mix weight.

Quantity of filler material to correct deficiencies in aggregate gradation passing the No. 200 sieve shall not exceed 3 percent by weight of fine aggregates.

(B) Job-Mix Formula and Tests. Design job-mix formula in accordance with procedures contained in current edition of Asphalt Institute's *Mix Design Methods for Asphalt Concrete and Other Hot Mix Types,* Manual Series No. 2 (MS-2) for either Marshall Method or Hveem Method of Mix Design.

Limit compacted lift thickness and asphalt content of job-mix formula as specified in Table 401.02-1 - Limits of Compacted Lift Thickness and Asphalt Content.

TABLE 401.02-1 - LIMITS OF COMPACTED LIFT THICKNESS AND ASPHALT CONTENT				
MIX NO.	II		IV	V
Minimum to Maximum	2-1/4	2	1-1/2	1-1/4
Compacted Thickness for	to	to	to	to
Individual Lifts (Inches)	3	3	3	3
Asphalt Content Limits	3.8	4.3	4.3	4.8
(Percent of Total Weight of	to	to	to	to
Mix)	6.1	6.1	6.5	7.0

 Asphalt content limits for porous aggregate may be exceeded only if it is requested ahead of placement and is reviewed then accepted in writing by the Engineer.

Meet job-mix formula design criteria specified in Table 401.02-2 - Job-Mix Formula Design Criteria.

TABLE 401.02-2 - JOB-MIX FORMULA DESIGN CRITERIA		
Hveem Method Mix Criteria (AASHTO T 246 and AASHTO T 247)		
Stability, minimum	37	
Air Voids (percent) ¹	3 - 5	
Marshall Method Mix Criteria (AASHTO T 245)		
Compaction (number of blows each end of specimen)	75	
Stability, minimum (pounds)	1,800	
Flow (x 0.01 inch)	8 - 16	
Air Voids (percent) ¹	3 - 5	
Notes: 1. Air Voids: AASHTO T 166 or AASHTO T 275; AASHTO T 209, AASHTO T 269.		

Minimum percent voids in mineral aggregates (VMA) of job-mix formula shall be as specified in Table 401.02-3 - Minimum Percent Voids in Mineral Aggregates (VMA).

TABLE 401.02-3 - MINIMUM PERCENT VOIDS IN MINERAL AGGREGATES (VMA)					
Nominal Maximum Particle Size, (Inches)	1-1/2	1	3/4	1/2	3/8
VMA, (percent) ¹	11.0	12.0	13.0	14.0	15.0
Notes: 1. VMA: See Asphalt Institute Manual MS-2					

(C) Submittals. Establish and submit job-mix formula for each type of HMA pavement mix indicated in the contract documents a minimum of thirty (30) days before paving production. Job mix shall include the following applicable information:

- (1) Design percent of aggregate passing each required sieve size.
- (2) Design percent of asphalt binder material (type determined by type of mix) added to the aggregate (expressed as % by weight of total mix),
- (3) Design proportion of processed RAP.
- (4) Design temperature of mixture at point of discharge at paver.

- 96 97
- (5) Source of aggregate.
- (6) Grade of asphalt binder.
- 99 100

101

108

109

110

116

(7) Test data used to develop job-mix formula.

Except for item (4) in this subsection, if design requirements are modified after the Engineer accepts job-mix formula, submit new job-mix formula before using HMA produced from modified mix design. Submit any changes to the design temperature of mixture at point of discharge for acceptance by the Engineer.

Submit a certificate of compliance for the asphalt binder, accompanied by substantiating test data from a certified testing laboratory.

111 **(D) Range of Tolerances for HMA.** Provide HMA within allowable 112 tolerances of accepted job mix formula as specified in Table 401.02-4 -113 Range of Tolerances HMA. These tolerances are not to be used for the 114 design of the job mix, they are solely to be used during the testing of the 115 production field sample of the HMA mix.

TABLE 401.02-4 - RANGE OF TOLERANCES HMA		
Passing No. 4 and larger sieves (percent)	± 7.0	
Passing No. 8 to No. 100 sieves (inclusive) (percent)	± 4.0	
Passing No. 200 sieve (percent)	± 3.0	
Asphalt Content (percent)	± 0.4	
Mixture Temperature (degrees F)	± 20	

117

118 The tolerances shown are the allowable variance between the physical 119 characteristics of laboratory job mix submitted mix design and the production 120 or operational mix, i.e., field samples.

122 **401.03 Construction.**

123

121

124 125

126 127

128

(A) Weather Limitations. Placement of HMA shall not be allowed under the following conditions:

(1) On wet surfaces, e.g., surface with ponding or running water, surface that has aggregate or surface that appears beyond surface saturated dry, as determined by the Engineer.

131 When air temperature is below 50 degrees F and falling. HMA (2) 132 may be applied when air temperature is above 40 degrees F and rising. Air temperature will be measured in shade and away from 133 134 artificial heat. 135 136 (3) When weather conditions prevent proper method of 137 construction. 138 139 **(B)** Equipment. 140 141 (1) **Mixing Plant.** Use mixing plants that conform to AASHTO M 156, supplemented as follows: 142 143 144 All Plants. (a) 145 146 1. Automated Controls. Control proportioning, 147 mixing, and mix discharging automatically. When RAP is incorporated into mixture, provide positive controls for 148 proportioning processed RAP. 149 150 151 2. **Dust Collector.** AASHTO M 156, Requirements 152 for All Plants, Emission Controls is amended as follows: 153 154 Equip plant with dust collector. Dispose of collected material. In the case of baghouse dust 155 156 collectors, dispose of collected material or return 157 collected material uniformly. 158 159 3. **Modifications for Processing RAP.** When RAP is incorporated into mixture, modify mixing plant in 160 accordance with plant manufacturer's recommendations 161 162 to process RAP. 163 164 (b) Drum Dryer-Mixer Plants. 165 1. 166 **Bins.** Provide separate bin in cold aggregate feeder for each individual aggregate stockpile in mix. 167 Use bins of sufficient size to keep plant in continuous 168 operation and of proper design to prevent overflow of 169 material from one bin to another. 170 171

172	2. Stockpiling Procedures. Separate aggregate
173	for Mix II, Mix III and Mix IV into at least three stockpiles
174	with different gradations as follows: coarse,
175	intermediate, and fine. Separate aggregates for Mix V
176	into at least two stockpiles. Stockpile RAP separately
177	from virgin aggregates.
178	
179	3. Checking Aggregate Stockpile. Check
180	condition of the aggregate stockpile often enough to
181	ensure that the aggregate is in optimal condition.
182	
183	(c) Batch and Continuous Mix Plants.
184	
185	1. Hot Aggregate Bin. Provide bin with three or
186	more separate compartments for storage of screened
187	aggregate fractions to be combined for mix. Make
188	partitions between compartments tight and of sufficient
189	height to prevent spillage of aggregate from one
190	compartment into another.
191	
192	2. Load Cells. Calibrated load cells may be used in
193	batch plants instead of scales.
194	
195	(2) Hauling Equipment. Use trucks that have tight, clean, smooth
196	metal beds for hauling HMA.
197	5
198	Thinly coat truck beds with a minimum quantity of non-stripping
199	release agent to prevent mixture from adhering to beds. Diesel or
200	petroleum-based liquid release agents, except for paraffin oil, shall not
201	be used. Drain excess release agent from truck bed before loading
202	with HMA.
203	
204	Provide a designated clean up area for the haul trucks.
205	5
206	Equip each truck with a tarpaulin conforming to the following:
207	
208	(a) In good condition, without tears and holes.
209	(4)
210	(b) Large enough to be stretched tightly over truck bed,
211	completely covering mix. The tarpaulin shall be secured in such
212	a manner that it remains stretched tightly over truck bed and
212	HMA mix until the bed is about to be raised up in preparation
213	for discharge.
215	
215	(3) Asphalt Pavers. Use asphalt pavers that are:
217	
'	

218 219	(a) Self-co	ontained, power-propelled units.
220	(b) Equipp	ed with activated screed or strike-off assembly,
220	heated if nece	•
222	neated if neot	555di y.
223	(c) Capab	le of spreading and finishing courses of HMA
223	· / ·	
225		lane widths applicable to typical section and ndicated in the contract documents.
225	unicknesses ii	lucated in the contract documents.
227		od with receiving henner having sufficient
		ed with receiving hopper having sufficient
228	capacity for u	niform spreading operation.
229		and with automatic faced controls to maintain
230	• • • • • •	bed with automatic feed controls to maintain
231	uniiorm deptr	of material ahead of screed.
232		ad with automatic caread controls with concern
233	• • • • • • •	bed with automatic screed controls with sensors
234		nsing grade from outside reference line, sensing
235		ope of screed, and providing automatic signals to
236	control screed	d grade and transverse slope.
237		
238		le of operating at constant forward speeds
239	consistent wit	h satisfactory laying of mixture.
240		
241		ed with a means of preventing the segregation of
242	the coarse a	aggregate particles from the remainder of the
243	bituminous pl	ant mix when that mix is carried from the paver
244	hopper back	to the paver augers. The means and methods
245	used shall be	e approved by the paver manufacturer and may
246	consist of cha	in curtains, deflector plates, or other such devices
247	and any com	pination of these.
248		
249	The fo	llowing specific requirements shall apply to the
250		minous pavers:
251		
252	1.	Blaw-Knox Bituminous Pavers. Blaw-Knox
253		bituminous pavers shall be equipped with the
254		Blaw-Knox Materials Management Kit (MMK).
255		······································
256	2.	Cedarapids Bituminous Pavers. Cedarapids
257		bituminous pavers shall be those that were
258		manufactured in 1989 or later.
259

296 297

298

299 300

301

302 303 3. Barber-Green/Caterpillar Bituminous Pavers. Barber-Green/Caterpillar bituminous pavers shall be equipped with deflector plates as identified in the December 2000 Service Magazine entitled "New Asphalt Deflector Kit {6630, 6631, 6640}".

Bituminous pavers not listed above shall have similar attachments or designs that shall make them equivalent to the bituminous pavers listed above. The Engineer will solely decide if it is equal to or better that the setups described for the equipment listed above.

Submit for review and acceptance, prior to the start of using the paver for the placing of plant mix, a full description in writing of the means and methods that will be used to prevent the bituminous paver from having both aggregate and temperature segregation. Use of any paver that has not been accepted is prohibited until acceptance of the paver is received from the Engineer. Any pavement placed with an unaccepted paver will be regarded as not compliant work and may not be paid for and may require removal.

Supply a Certificate of Compliance that verifies that the manufacturer's approved means and methods used to prevent bituminous paver from having both aggregate and temperature segregation have been implemented on all pavers used on the project and are working in accordance with the manufacturer's requirements and Contract Documents.

(4) **Rollers.** Rollers shall be self-propelled, steel-tired tandem, pneumatic-tired, or vibratory-type rollers capable of reversing without shoving or tearing the just placed HMA mixture. Provide sufficient number, sequencing, type, and rollers of sufficient weight to compact the mixture to required density while mixture is still in workable condition. Equipment shall not excessively crush aggregate. Operate rollers in accordance with manufacturer's recommendations and Contract Documents. The use of intelligent compaction is encouraged and may be required elsewhere in the Contract Documents.

(a) Steel-Tired Tandem Rollers. Steel-tired tandem rollers used for initial breakdown or intermediate roller passes shall have minimum gross weight of 12 tons and shall provide minimum 250-pound weight per linear inch of width on drive wheel.

304 305

Steel-tired tandem rollers used for finish roller passes

shall have minimum total gross weight of 3 tons.

345

346

347 348 349

350 351 Do not use roller with grooved or pitted rolling drum or worn scrapers or wetting pads. Replace excessively worn scrapers and wetting pads before use.

(b) **Pneumatic-Tired Rollers.** Pneumatic-tired rollers shall be oscillating-type, equipped with smooth-tread pneumatic tires of equal size and diameter. Maintain tire pressure within 5 pounds per square inch of designated operational pressure when hot. Space tires so that gaps between adjacent tires are covered by following set of tires.

Pneumatic-tired rollers used for breakdown or intermediate roller passes shall have a ballast capable of establishing an operating weight per tire of not less than 3,000 pounds. Equip rollers with tires having minimum 20-inch wheel diameter with tires inflated to 70 to 75 pounds per square inch pressure when cold and 90 pounds per square inch when hot. Equip rollers with skirt-type devices to maintain temperature of tires during rolling operations.

Pneumatic-tired rollers used for kneading finished asphalt surfaces shall have a ballast capable of establishing an operating weight per tire of not less than 1,500 pounds. Equip rollers with tires having minimum 15-inch wheel diameter with tires inflated to 50 to 60 pounds per square inch pressure. If required, equip rollers with skirt-type devices to maintain temperature of tires during rolling operations.

(c) Vibratory Rollers. Vibratory rollers shall be steel-tired tandem rollers having minimum total weight of 3 tons. Equip vibratory rollers with amplitude and frequency controls and speedometer. Operate vibratory roller in accordance with manufacturer's recommendations. For very thin lifts, 1 inch or less in thickness, vibratory rollers shall not be used in the vibratory mode. Instead, operate the unit in the static mode.

(5) Hand Tools. Keep hand tools used in production, hauling, and placement of HMA clean and free of contaminants. Diesel or mineral spirits or other cleaning material that is potentially deleterious to HMA may be used to clean hand tools providing:

- (a) It does not contaminate HMA with cleaning material.
- (b) Clean hand tools over catch pan with capacity to hold all

352 353	the c	eaning	material.
355 354 355 356 357		rial that	ove all diesel or mineral spirits or other cleaning t is potentially deleterious to HMA from hand tools with HMA.
358 359 360 361	straig	require	tools used shall be in a condition such that it meets ments that it was manufactured for, e.g., a shall meet the straightness requirement of the er.
362 363 364	(6) Mate	rial Tra	ansfer Vehicle (MTV).
365 366 367 368 369	Wher delive	cts on a n placin er mixtu	e. MTV usage applies to surface courses of paving all Islands except Lanai, unless otherwise indicated. Ing HMA surface course use MTV to independently ures from hauling equipment to paving equipment. will not be required for the following:
370 371 372		1.	Projects with less than 1,000 tons of HMA.
372 373 374		2.	Temporary pavements.
375		3.	Bridge deck approaches.
376 377 278		4.	Shoulders.
378 379		5.	Tapers.
380 381		6.	Turning lanes.
382 383		7.	Driveways.
384 385		8.	Areas with low overhead clearances.
386 387 388 389		city hop	oment. When using MTV, install minimum 10-ton- oper insert in conventional paver hopper. Provide g equipment:
390 391 392 393		1. capat	High-capacity truck unloading system in MTV ole of receiving HMA from hauling equipment.
393 394 395		2.	MTV storage bin with minimum 15-ton capacity.
395 396 397		3. the M	An auger mixing system in one of the following: ITV storage bin, or paver hopper insert, or paver

hopper to continuously mix HMA prior to discharging to the paver's conveyor system.

Avoid stop-and-go operations by coordinating plant production rate, number of haul units, and MTV and paver speeds to provide a continuous, uniform, segregation-free material flow and smooth HMA pavement. Maintain uniform paver speed to produce smooth pavements.

(c) **Performance Evaluation**. Evaluate the performance of MTV and mixing equipment by measuring mat temperature profile immediately behind paver screed on first day of paving and when it feels the need to do so due to perceived changes in performance or as directed by the Engineer.

Use a hand-held temperature device that has been calibrated within the past twelve (12) months. It shall be an infrared temperature gun is capable of measuring in one degree or finer increments between the temperatures of 80 degrees to 400 degrees F with a laser to indicate where the temperature reading is being taken. Six temperature profile measurements shall be taken of mat surface using infrared temperature gun at 50-foot intervals behind paver. Each temperature profile shall consist of three surface temperature measurements taken transversely across the mat in approximately a straight line from screed while paver is operating. For each profile, temperatures shall be measured approximately 1 foot from each edge and in middle of mat. The difference between maximum and minimum temperature measurements for each temperature profile shall not exceed 10 degrees F. If any two or more temperature profiles exceeds the allowable 10-degree F temperature differential, halt paving operation and adjust MTV or mixing equipment to ensure that material placed by paver meets specified temperature requirements. Redo the measuring of mat temperature profile until adjustment of the MTV or mixing equipment is adequate. Submit all temperature profiles to the Engineer by next business day. Information on the report shall show location and temperature readings and time test was performed. Enough information shall be given, so the Engineer will be able to easily locate the test site of the individual measurement.

440When requested temperature profile measurements441shall be done in the presence of the Engineer.442Once adjustments are made, repeat measurement

Once adjustments are made, repeat measurement procedure for the next two placements to verify that material

placed by paver meets specified temperature requirements. Terminate paving if temperature profile requirements are not met during repeated measurement procedure. If equipment fails to meet requirements after measurement procedure is repeated once, replace equipment before conducting any further temperature profile measurements

The Engineer may perform surface temperature profile measurements at any time during project. The Engineer may in lieu of a hand-held infrared temperature device use an infrared camera or device that is capable of measuring temperatures to locate cold spots. If such cold spots exist, the Engineer may require adjustments to the MTV.

If bleeding or fat spots occur in the pavement adjust means and methods to eliminate such pavement defects and perform remedial repair to pavement acceptable to the Engineer. Bleeding is defined as excess binder occurring on the surface of the pavement. It may create a shiny, glass-like, reflective appearance and may be tacky to the touch. Fat spots are localized bleeding.

(d) Transport.

1. Trailered MTV. Transport MTV by means of truck-tractor/trailer combination in accordance with Chapter 104 of Title 19, Department of Transportation, entitled "The Movement by Permit of Oversize and Overweight Vehicles on State Highways".

2. Crossing Bridges for Self-Powered MTV. When self-powered MTV exceeds legal axle or total weight limits for vehicles under the HRS, Chapter 291, conform to the following when crossing bridges within project limits unless otherwise indicated in the Contract Documents:

a. Completely remove mix from MTV.

b. Move MTV at relatively constant speed not exceeding 5 miles per hour. MTV will not be allowed to stop on bridge.

487	c. No other vehicle or equipment will be
488	allowed on bridge.
489	
490	d. The MTV shall not attempt to cross a
491	bridge where the posted load limit is less than or
492	equal to the weight of the MTV empty.
493	Permission to cross the bridge shall be obtained
494	from the Engineer and HWY-DB in writing.
495	nom the Engineer and third DB in writing.
496	(C) Preparation of Surface. Clean existing pavement in accordance with
497	Section 310 - Brooming Off. Apply tack coat in accordance with Section 407
498	- Tack Coat. Tack coat shall not be applied to surfaces to receive an
499	application of joint adhesive.
500	application of joint adhesive.
501	Where indicated in the Contract Documents, bring irregular surfaces
502	to uniform grade and cross section by furnishing and placing one or more
502	leveling courses of HMA Mix V. Spread leveling course in variable
503 504	thicknesses to eliminate irregularities in existing surface. Place leveling
505	course such that maximum depth of each course, when thoroughly
505	compacted, does not exceed 3 inches.
500 507	compacted, does not exceed 5 inches.
508	In multiple lift leveling equires construction, enread subsequent lifts
	In multiple-lift leveling course construction, spread subsequent lifts
509 510	beyond edges of previously spread lifts in accordance with procedures
	contained in current edition of the Asphalt Institute's <i>Construction of Hot Mix</i>
511	Asphalt Pavements, Manual Series No. 22 (MS-22) for leveling wedges.
512	Notify the Engineer of existing surfaces that may not be in a condition
513	Notify the Engineer of existing surfaces that may not be in a condition
514	that will have enough strength to be a good bonding surface or foundation
515	and should be removed or have remedial repairs done before new pavement
516	placement.
517	(D) Plant Oneration
518	(D) Plant Operation.
519 520	(1) Preparation of Asphalt Binder . Uniformly heat asphalt binder
521 522	and provide continuous supply of heated asphalt cement from storage
522 523	to mixer. Do not heat asphalt binder above the recommendation of the supplier for modified binders or above 350 degrees F for neat
525 524	binders.
	billuers.
525 526	(2) Propagation of Aggregate Dry and best aggregate material
526 527	(2) Preparation of Aggregate. Dry and heat aggregate material
527 528	at temperature sufficient to produce design temperature of job-mix
528 520	formula. Do not exceed 350 degrees F. Adjust heat source used for
529 520	drying and heating to avoid damage to and contamination of
530 531	aggregate. When dry, aggregate shall not contain more than 1
531 522	percent moisture by weight.
532	For batch plants, screen aggregates immediately after heating

572

and drying into three or more fractions. Convey aggregates into separate compartments ready for batching and mixing with asphalt binder.

(3) Mixing. Measure aggregate and asphalt; or aggregate, RAP, and asphalt into mixer in accordance with an accepted job-mix formula. Mix until components are completely mixed and adequately coated with asphalt binder in accordance with AASHTO M 156. Percent of coated particles shall be 95 percent when tested in accordance with AASHTO T 195.

(4) **Plant Inspection.** For control and acceptance testing during periods of production, provide a testing laboratory that meets the requirements of AASHTO M 156. Provide space, utilities, and equipment required for performing specified tests.

549 (E) **Spreading and Finishing.** Prior to each day's paying operation, check screed or strike-off assembly surface with straight edge to ensure 550 551 straight alignment and there is no damage or wear to the machine that will affect performance. Provide screed or strike-off assembly that produces 552 finished surface without tearing, shoving, and gouging HMA. Discontinue 553 554 using spreading equipment that leaves ridges, indentations, or other marks, 555 or combination thereof in surface that cannot be eliminated by rolling or affects the final smoothness of the pavement or be prevented by adjustment 556 557 in operation.

559 Maintain HMA at minimum 250 degrees F temperature at discharge to 560 paver. The Engineer shall observe the contractor measuring the temperature 561 of mix in hauling vehicle just before depositing into spreader or paver or MTV. 562

Deposit HMA in a manner that minimizes segregation. Raise truck beds with tailgates closed before discharging HMA.

Lay, spread, and strike off HMA upon prepared surface. Where practical, use asphalt pavers to distribute mixture.

Where practical, control horizontal alignment using automatic grade and slope controls from reference line, slope control device. Existing pavements or features shall not be used for grade control alone.

573 Obtain sensor grade reference, horizontal alignment by using 574 established grade and slope controls. For subsequent passes, substitution 575 of one ski with joint-matching shoe riding on finished adjacent pavement is 576 acceptable. Use of a comparable non-contact mobile reference system and 577 joint matching shoe is acceptable.

578

Avoid stop-and-go operation. Maintain a constant forward speed of

579 paver during paving operation and minimize other methods that impact 580 smoothness.

609

614

582 Offset longitudinal joint in successive lifts by approximately 6 inches. Incorporate into paving method an overlap of material of 1-inch +/-0.5 inches 583 584 at the longitudinal joint. The HMA overlap material shall be left alone when 585 initially placed and shall not be bumped back or pushed back with a lute or any other hand-held device. If the overlap exceeds the maximum amount, 586 587 remove the excess with a flat shovel, allowing recommended amount of 588 overlap HMA material to remain in place to be compacted. Do not throw the 589 removed excess HMA material on to the paving mat. The longitudinal joint 590 in a surface course when total roadway width is comprised of two lanes shall be near the centerline of pavement or near lane lines when roadway is more 591 592 than two lanes in width. The longitudinal joint shall not be constructed in the 593 wheel path or under the longitudinal lane lines. Make a paving plan drawing 594 showing how the longitudinal joint will not be located in these areas.

Control the horizontal alignment of the longitudinal edge of the HMA mat being installed so that the edge is parallel to the centerline or has a uniform alignment, e.g., the edge of the mat is straight line or uniform curve, no wavy edge, etc. to have a consistent amount of HMA material at the joint.

Check the compaction of the longitudinal joint during paving often enough to ensure that it will meet the compaction requirements.

If nuclear gauges and ground penetrating radar are used as the contractor's quality control method, they shall be properly calibrated and periodically checked by comparison to cores taken from the pavement. The use of sand as an aid in properly seating the gauge may also be considered for improving the accuracy of the gauge.

In areas where irregularities or unavoidable obstacles make use of
 mechanical spreading and finishing equipment impracticable, spread, rake,
 and lute mixture by hand tools. For such areas, deposit, spread evenly, and
 screed mixture to required compacted thickness.

615 Demonstrate competence of personnel operating grade and crown control device before placing surface courses. If automatic control system 616 617 becomes inoperative during the day's work, the Engineer will permit the Contractor to finish day's work using manual controls. The Engineer may 618 619 also allow additional HMA to be ordered and placed using manual controls if 620 it will provide a safer work site for the public to travel through. Do not resume work until automatic control system is made operative. The Engineer may 621 waive requirement for electronic screed control device when paving gores, 622 623 shoulders, transitions, and miscellaneous reconstruction areas where the use of the devices is not practical. 624

- 625 When production of HMA can be maintained and when practicable, 626 use pavers in echelon shall be used to place surface course in adjacent 627 lanes.
- 629 At the end of each workday, HMA pavement that is open to traffic shall 630 not extend beyond the panel of the adjacent new lane pavement by more 631 than the distance normally placed in one (1) work day. At end of each day's 632 production, construct tapered transitions along all longitudinal and transverse 633 pavement drop-offs; this shall apply to areas where existing pavement is to 634 meet newly placed pavement. Use slopes of 6:1 for longitudinal taper transitions and 48:1 for transverse tapered transitions. Maximum drop-off 635 636 height along the joints shall be 2 inches. Also, using a 48:1 slope provides a taper around any protruding object, e.g., manholes, drain boxes, survey 637 638 monuments, inlets, etc., that may be above pavement surface when opened 639 to the public. If the object is below the surface of the pavement then fill the 640 depression until it is level with the surrounding pavement or raise depressed 641 objects to the finish grade of the placed pavement. Remove and dispose of 642 all transition tapers before placing adjoining panel or next layer of HMA. 643 Notify traveling public of pavement drop-offs or raised objects with signs 644 placed in every direction of traffic that may use and encounter pavement 645 drop-offs or protruding objects or holes.
- 646 647

659

663

664

665

668

Use the same taper rates for areas where there is a difference in elevation due to construction work.

At end of each workweek, complete full width of the roadway's pavement, including shoulders, to same elevation with no drop-offs.

(F) Compaction. Immediately after spreading and striking off HMA and adjusting surface irregularities, uniformly compact mixture by rolling.

Initiate compaction at highest mix temperature allowing compaction without excessive horizontal movement. Temperature shall not be less than 220 degrees F.

660 Finish rolling using tandem roller while HMA temperature is at or
661 above 175 degrees F.
662

On superelevated curves, begin rolling at lower edge and progress to higher edge by overlapping of longitudinal trips parallel to centerline.

666 If necessary, repair damage immediately using rakes and fresh mix. 667 Do not displace line and grade of HMA edges during rolling.

669 Keep roller wheels properly moistened with water or water mixed with 670 small quantities of detergent. Use of excess liquid, diesel, and petroleumbased liquids will not be allowed on rollers.

710 711

712 713

714 715 716 Along forms, curbs, headers, walls and other places not accessible to rollers, compact mixture with hot hand tampers, smoothing irons, or mechanical tampers. On depressed areas, trench roller or cleated compression strips under roller may be used to transmit compression.

678 Before the start of compaction or during compaction or both remove 679 pavement that is loose, broken, or contaminated, or combination thereof; 680 pavement that shows an excess or deficiency in asphalt binder content; and 681 pavement that is defective in any way. Replace with fresh HMA pavement of 682 same type, and compact. Remove and replace defective pavement and 683 compact at no increase in contract price or contract time.

Operate rollers at slow and uniform speed with no sudden stops. The drive wheels shall be nearest to the paver. Continue rolling to attain specified density and until roller marks are eliminated.

Rollers shall not be parked on the pavement placed that day or shift.

(1) HMA Pavement Courses One and a Half Inches Thick or Greater. Where HMA pavement compacted thickness indicated in the Contract Documents is 1-1/2 inches or greater, compact to not less than 93.0 percent nor greater than 97.0 percent of the maximum specific gravity determined in accordance with AASHTO T 209, modified by deletion of Supplemental Procedure for Mixtures Containing Porous Aggregate.

Place HMA pavement in individual lifts that are within minimum and maximum allowable compacted thickness for various types of mixture as specified in Table 401.02-1 - Limits of Compacted Lift Thickness and Asphalt Content.

(2) HMA Pavement Courses Less Than One and a Half Inches Thick. Where HMA pavement compacted thickness indicated in the contract documents is less than 1-1/2 inches, compaction to a specified density will not be required.

Use only non-vibratory, steel-tired, tandem roller. Roll entire surface with minimum of two roller passes. A roller pass is defined as one trip of the roller in one direction over any one spot.

- For intermediate rolling, roll entire surface with minimum of four passes of roller.
 - Finish rolling using steel-tired, tandem roller. Continue rolling

717 until entire surface has been compacted with minimum of three passes 718 of roller, and roller marks have been eliminated. 719 720 Do not use rollers that will excessively crush aggregate. 721 722 HMA Pavement Courses One and a Half Inches Thick or (3) 723 Greater In Special Areas Not Designated For Vehicular Traffic. 724 For areas such as bikeways that are not part of roadway and other 725 areas not subjected to vehicular traffic, compact to not less than 90.0 726 percent of maximum specific gravity determined in accordance with AASHTO T 209, modified by deletion of Supplemental Procedure for 727 Mixtures Containing Porous Aggregate. Increase asphalt content by 728 at least 0.5 percent above that used for HMA pavements designed for 729 730 vehicular traffic. Paved shoulders shall be compacted in the same manner as pavements designed for vehicular traffic. 731 732 733 (G) Joints, Trimming Edges and Utility Marking. At HMA pavement connections to existing pavements, make joints vertical to depth of new 734 735 pavement. Saw cut existing pavement and cold plane in accordance with Section 415 - Cold Planing of Existing Pavement to depth equal to thickness 736 of surface course or as indicated in the Contract Documents. 737 738 739 At HMA connections to previously placed lifts, form transverse joints 740 by cutting back on previous run to expose full depth of course. Dispose of 741 material trimmed from edges. Protect end of freshly laid mixture from rollers. 742 743 Before and after paving, identify and mark location of existing utility 744 manholes, valves, and handholes on finished surface. Adjust existing frames 745 and covers and valve boxes to final pavement finish grade in accordance with Section 604 - Manholes, Inlets and Catch Basins and Section 626 - Manholes 746 and Valve Boxes for Water and Sewer Systems. 747 748 749 (1) Longitudinal joints. Submit for review the means and methods 750 that will be used to install longitudinal joints at the required compaction 751 and density. Compact longitudinal joints to be not less than 91.0 percent of the maximum specific gravity determined in accordance 752 with AASHTO T 209, modified by deletion of Supplemental Procedure 753 754 for Mixtures Containing Porous Aggregate. Verify the compaction of the longitudinal joints meets requirements by using non-destructive 755 testing methods during paving and submit the results on the daily 756 757 quality control test reports. 758 759 Test for compaction and density regardless of layer thickness. Compaction and density of the longitudinal joint shall be determined by using 760 six-inch diameter cores. For longitudinal joints made using butt joints cores 761

761six-inch diameter cores. For longitudinal joints made using butt joints cores762shall be taken over the joint with half of the core being on each side of the

763 joint. For longitudinal joints using butt wedge joints, center core over the 764 center of the wedge so that 50 percent of the material is from the most 765 recently paved material and the remaining 50 percent of the core is from the 766 material used to pave the previous layer. One core shall be taken at a 767 maximum of every 250 tons of longitudinal joint and any fraction of that length 768 for each day of paving with a minimum of one core taken for each longitudinal 769 joint per day. Cores taken for the testing of the longitudinal joint may be used 770 to determine pavement thickness.

772 When the longitudinal joints are found to have less than 91.0 percent of the maximum specific gravity, overband all longitudinal joints within the 773 774 entire lot represented by the non-compliant core, PG binder seal coat, or 775 other type of joint enrichment accepted by the Engineer. The overband shall 776 not decrease the skid resistance of the pavement under any ambient weather Submit overband material's catalog cuts, test results and 777 condition. 778 application procedure for review and acceptance by the Engineer before use. 779 Center the overband over the longitudinal joint. The overband shall be placed in a uniform width and horizontal alignment. The overband shall have no 780 781 holidays or streaking in its placement. The width of the overband shall be based on how the longitudinal joint was constructed or as directed by the 782 Engineer. If a butt joint is used, the overband width shall be a minimum of 783 784 12-inches. For butt wedge or wedge joints the overband width shall be the 785 width of the wedge plus an additional six-inches minimum. Replace any pavement markings damaged or soiled by the overband remedial repair 786 787 process.

788 789

790

791

792 793

794

795 796

797

771

For longitudinal joints that have a compaction of less than 89 percent of the maximum specific gravity; removal may be required by the Engineer instead of overbanding the non-compliant joint.

Persistent low compaction results may be cause to suspend work and remove non-conforming work. During the suspension of paving, revise means and methods used in constructing longitudinal joints and submit to the Engineer for review and acceptance. Suspension may occur when:

- 798 799
- 800 801

802

(1) Two or more longitudinal joints tests fail to meet the minimum compaction

(2) One sample reveals that the joint compaction is 89 percent or less.

803 HMA Pavement Samples. Obtain test samples from compacted **(H)** 804 HMA pavement within 72 hours of lay down. Provide minimum 4-inch 805 diameter cores consisting of undisturbed, full-depth portion of compacted 806 mixture taken at locations designated by the Engineer in accordance with the 807 "Sampling and Testing Guide for Acceptance and Verification" in Hawaii DOT 808 Highways Division, Quality Assurance Manual for Materials, Appendix 3. 809 Cores shall be taken in the presence of the Engineer. Turn cores over to 810 Engineer immediately after cores have been taken.

812 For pavement samples for longitudinal joints provide 6-inch diameter cores minimum. For pavement samples for other than longitudinal joints 813 814 4-inch diameter cores minimum shall be taken. All cores shall consist of 815 undisturbed, full-depth of the lift of the compacted mixture taken at locations 816 designated by the Engineer in accordance with the "Sampling and Testing 817 Guide for Acceptance and Verification" in Hawaii DOT Highways Division, 818 Quality Assurance Manual for Materials, appendix 3. Coring of longitudinal joints shall use a modified HDOT Sampling and Testing Guide as required 819 820 by the Contract Documents. 821

Cores that separate shall indicate to the Engineer that there is insufficient bonding of layers. Modify the previously used paving means and methods to prevent future debonding of layers. Debonding of a core sample after adjustment of the Contractor's methods will be an indication of continued non-conforming work and the Engineer may direct removal of the layer at no additional cost or contract time.

- 829 Restore HMA pavement immediately after obtaining samples. Clean core 830 hole and walls of all deleterious material that will prevent the complete filling 831 of the core hole and the bonding of the new HMA to the existing. Apply tack coat to vertical faces of sample holes. Fill sampled area with new HMA 832 pavement of same type as that removed. If hand compaction is used; fill in 833 834 layers not exceeding the minimum thickness stated in Table 401.02-1 - Limits 835 of Compacted Lift Thickness And Asphalt Content. Compact each layer to 836 compaction requirements. If Mechanical Compaction methods are used, then 837 layers may be the maximum layer thickness stated in Table 401.02-1 - Limits 838 of Compacted Lift Thickness And Asphalt Content. Using tires or hand 839 tamping to compact the HMA material to restore the pavement shall not be 840 considered as mechanical compaction.
- 841 842

828

- Only sample and test leveling course if 1-1/2 inches or greater. No compaction requirements for less than 1-1/2 inches.
- 843 844 845

846 847

- (I) HMA Pavement Thickness Tolerances.
- The Engineer will measure thickness of pavement by cores obtained by the Contractor in accordance with HDOT TM 09-19 Field Sampling

- 849 Bituminous Material after Compaction (Obtaining Cores). The Engineer will 850 measure cores in accordance with HDOT TM 09-19, except that 851 measurement will be taken to nearest one thousandth of an inch; and 852 average of such measurements will be taken to nearest one hundredth of an 853 inch.
- Thickness of finished HMA pavement shall be within 0.25 inch of thickness indicated in the Contract Documents. Pavement not meeting the thickness requirements of the Contract Documents may be required by the Engineer to be removed and replaced.

Corrective methods taken on pavement exceeding specified tolerances, e.g., insufficient thickness by methods accepted by the Engineer, including removal and replacement, shall be at no increase in contract price or contract time.

The checking of pavement thickness shall be done after all remedial repairs, e.g., smoothness compliance repairs, compaction, have been completed, reviewed, and accepted by the Engineer.

- 869 Quality Control Using New Technology. The Engineer and MTRB (J) 870 reserves the right to utilize new technology and methods to improve the 871 detection of noncompliant work on the project. The technology or method may be used to locate defects in the work, e.g., ground penetrating radar to 872 873 locate delaminations, moisture damage, thin sections, voids, non-compliant 874 compaction, other non-destructive testing to locate flaws. The defect will be verified by the methods stated in the Contract Documents or by other 875 established conventional means. If the technology or method has already 876 877 been accepted elsewhere or has standardized testing procedures the results may be judged acceptable by the Engineer and no further testing will be 878 required. These new technologies and methods may be used for the 879 880 selection of sampling locations.
 - **(K) Protection of HMA Pavement.** Except for construction equipment directly connected with paving operations, keep traffic off HMA pavement.
- 884 885 886

887

888

889 890

891

881

882

883

854

859 860

861 862

863 864

865

866

867 868

Protect HMA pavement from damage until it has cooled and set.

Do not refuel equipment or clean equipment or hand tools over paved surfaces unless catch pan or device that will contain spilled fuel and other products is provided. After completion of refueling or cleaning, remove catch pan or device without spilling any of the collected content.

- 892Do not park roller or other paving equipment on HMA pavement paved893within 24 hours of laydown.
- 894

895	(L)	Pavement Joint Adhesive
896		
897		(1) Pavement Joint Adhesive on Joints. Use on all asphalt
898		pavement construction where joints are formed at such
899		locations but not limited to the following:
900		
901		(a) Adjacent asphalt pavements, e.g., trafficked lanes,
902		shoulders, etc.
903		
904		(b) Asphalt pavement and adjacent concrete pavement or
905		curb and gutter or any other surface where the bonding of the
906		asphalt pavement and concrete surface is desired,
907		
908		(c) Transverse joints between asphalt pavements not
909		placed at the same time or if the pavement's temperature on
910		one side of the joint is below the minimum temperature the mix
911		can be at, during asphalt pavement compaction or installation.
912		- ···· ··· ···························
913		(d) Cut face of an existing pavement where it will have new
914		HMA pavement placed against it, e.g., utility trenches, partial or
915		full depth repairs, etc.
916		······································
917		Pavement joint adhesive is not required on a longitudinal
918		construction joint between adjacent hot mix asphalt pavements
919		formed by echelon paving. Echelon paving is defined as paving
920		multiple lanes side-by-side with adjacent pavers slightly offset at the
921		same time.
922		
923		A longitudinal construction joint between one shift's work and
924		another shall have pavement joint adhesive applied at the joint. Any
925		longitudinal construction joint formed, with the temperature on one
926		side of the joint that is below the minimum temperature the mix can be
927		when compacted to contract requirements during asphalt pavement
928		installation, shall have pavement joint adhesive applied at the joint.
929		
930		(2) Material requirements. Asphalt joint adhesive shall meet
931		requirements as specified in Table 401.03-1 - Asphalt Joint Adhesive
932		Specifications.
933		
,		

TABLE 401.03-1 – ASPHALT JOINT ADHESIVE SPECIFICATIONS

Softening Point	ASTM D 36	77 °C [170 °F] min.		
Asphalt Compatibility	ASTM D 5329	Pass		

(3) Construction Requirements for Asphalt Joint Adhesive

(a) Equipment Requirements. Use a jacketed double boiler type melting unit, with both agitation and recirculation systems. Provide a pressure feed wand application system.

(b) Material Handling. Submit a copy of the manufacturer's recommendations for heating, re-heating, and applying the joint adhesive material. Follow manufacturer's recommendations. Do not remove the joint adhesive from the package until immediately before it is placed in the melter. Joint adhesive boxes must be clearly marked with the name of the manufacturer's batch and lot number, the application/pour temperature, and the safe heating temperature. Feed additional material into the melter at a rate equal to the rate of material used.

Verify the pouring temperature of the joint adhesive at least once per hour at the point of discharge. Stop production if the adhesive falls below the recommended application/pour temperature. When the temperature of the adhesive exceeds the maximum safe heating temperature, stop production, empty the melter, and dispose of that adhesive in an environmentally safe method. No payment will be made for this material or its disposal.

Do not blend or mix different manufacturer's brands or different types of adhesives.

(c) Joint Adhesive Application: The face of the joint that the new asphalt pavement will bind to shall be clean and dry

967 968 969 970 971 972	before the joint adhesive is applied. Apply the pavement joint adhesive material to the entire face of the surface where HMA pavement shall be installed. The thickness of the asphalt adhesive application shall be approximately 1/8 inch. Use an application shoe attached to the end of application wand. Do not overlap the joint by greater than 1/2-inch at the top of the
973 974 975 976	joint or two-inches at the bottom of the joint. Apply the joint adhesive immediately in front of the paving operation. If the adhesive is tracked by construction vehicles, repair the damaged area, and restrict traffic from driving on the adhesive.
977 978 979 980 981 982	(d) Field Sampling. Take a sample from the application wand during the first twenty (20) minutes of placing sealant. One sample should be taken per manufacturer's batch or minimum of every six (6) months on the Project in the presence of the Engineer.
983 984 985 986 987 988	Each sample shall consist of one quart in an aluminum or steel sample container. The sampling container shall be labeled with Contractor's name; project name and number; date and time sample taken; location of where material was used at, e.g., from where to where it was used at in stations; manufacturer and lot
988 989 990 991 992 993	number of the sealant. Turn over samples to Engineer without Engineer losing sight of the sample. The Engineer reserves the right to conduct supplementary sampling and testing of the sealant material.
994 995 996 997 998 999 1000	(M) Pavement Smoothness Rideability Test. Perform surface profile tests frequently to ensure that the means and methods being used produces pavement that is compliant with the surface profile smoothness requirement. Test the pavement surface for smoothness with High-Speed Inertial Profiler to determine the International Roughness Index (IRI) of the pavement. For the locations determined by the Engineer, a 10-foot straightedge shall be used to measure smoothness.
1001 1002 1003 1004 1005	All smoothness testing must be performed with the presence of the Engineer. The High-Speed Inertial Profiler operator shall be a certified operator by MTRB or the manufacturer.
1005 1006 1007 1008 1009	The High-Speed Inertial Profiler operator's certification shall be no older than five (5) years old at the date of the Notice to Proceed and at the day of the pavement profile measurement.
1010 1011	The finished pavement shall comply to all the following requirements:

1012 Smoothness Test using 10-Foot Straightedge (Manual or (a) 1013 rolling) The 10-foot straightedge is used to identify the locations that vary more than 3/16 inch from the lower edge when the 10-foot 1014 1015 straightedge is laid on finished pavement on the direction parallel with the centerline or perpendicular to centerline. Remove the high points 1016 that cause the surface to exceed that 3/16 inch tolerance by grinding. 1017 1018 1019 The Contractor shall use a 10-foot straightedge for the following 1020 locations: 1021 1022 1. Longitudinal profiling parallel to centerline, when within 15 feet of a bridge approach or existing pavement which is 1023 1024 being joined. 1025 Transverse profiling of cross slopes, approaches, and as 1026 2. 1027 otherwise directed. Lay the straightedge in a direction 1028 perpendicular to the centerline. 1029 3. 1030 When pavement abuts bridge approaches or pavement not under this Contract, ensure that the longitudinal slope 1031 deviations of the finished pavement comply with Contract 1032 Document's requirements. 1033 1034 Short pavement sections up to 600 feet long, including 1035 4. both mainline and non-mainline sections on tangent sections 1036 1037 and on horizontal curves with a centerline radius of curve less than 1,000 feet. 1038 1039 1040 5. Within a superelevation transition on horizontal curves having centerline curve radius less than 1,000 feet, e.g., 1041 curves, turn lanes, ramps, tapers, and other non-mainline 1042 pavements. 1043 1044 Within 15 feet of transverse joint that separates 1045 6. pavement from existing pavement not constructed under the 1046 contract, or from bridge deck or approach slab for longitudinal 1047 profiling. 1048 1049 1050 7. At miscellaneous areas of improvement where width is 1051 less than 11 feet, such as medians, gore areas, and shoulders. 1052 1053 8. As otherwise directed by the Engineer. The Engineer may confine the checking of through traffic lanes with the 1054 straightedge to joints and obvious irregularities or choose to 1055 use it at locations not specifically stated in this Section. 1056 1057

(b) High-Speed Inertial Profiler

There shall be a minimum 3 profile runs per lane, for each wheel path (left and right) which is approximately three feet from edge lane line. The segment length shall be 0.1 mi. The final segments in a lane that are less than 0.1 mi shall be evaluated as an independent segment and pay adjustments will be prorated for length. The profiles shall be taken in the direction of traffic only.

The latest version of FHWA ProVAL software shall be used to conduct profile analysis to determine IRI and areas of localized roughness. The IRI values shall be reported in units of in/mi.

Areas of localized roughness will be identified by using ProVAL's "Smoothness Assurance" analysis, calculating IRI with a continuous short interval of 25 feet and the 250-mm filter applied.

Additional runs may be required by the Engineer if the data indicate a lack of repeatability of results. A 92% agreement is required for repeatability and IRI values shall have at minimum a 95% confidence level.

(N) Required Pavement Smoothness

The IRI for the left and right wheel paths in an individual lane will be computed and then averaged to determine the Mean Roughness Index (MRI) values. The MRI will be used to determine acceptance and pay adjustment. Each lane shall be tested and evaluated separately.

There are three (3) categories of target MRI values:

TABLE 401.03-2 – PAVEMENT SMOOTHNESS CATEGORIES		
Category	Description	MRI
Туре А	Three or more opportunities for improving ride	Shall not exceed 60 in/mi
Туре В	Two opportunities for improving ride	Shall not exceed 70 in/mi
Туре С	One opportunity for improving ride	Shall not exceed 75 in/mi

 An opportunity for improving ride is considered as one (1) lift of asphalt pavement, including but not limited to HMAB, HMA, PMA, and SMA.

For the location where a 10-foot manual straightedge is required, the surface shall not vary more than 3/16 inch from the lower edge of a straightedge.

No pre-final inspection, final inspection, and substantial completion granted will be made until the pavement meets smoothness requirement and all required profile reports are submitted to the Engineer and MTRB and are accepted.

(O) Request for Profile Testing by the Department.

For Type C, prior to pavement activities, the Engineer will measure the smoothness of the existing pavement.

The Contractor shall submit a written request to the Engineer to perform all required profile tests.

The request shall be made at least thirty (30) days before desired testing date and shall include an approximate acceptance profile testing date, a plan view drawing of the area to be tested with the limits of the test area highlighted.

The Contractor shall reimburse HDOT for any incurred cost related to any Contractor-caused cancellation or a deduction to the monthly payment will be made.

(P) Department Requirements for Profile Testing. When a request for testing is made, the requested area to be tested shall be 100% of the total area indicated to be paved in the Contract Documents unless the requirement is waived by the Engineer and MTRB.

Department acceptance surface tests will not be performed earlier than fourteen (14) days after HMA placement.

Clean debris and clear obstructions from area to be tested, as well as a minimum of 100 feet before and beyond the area to be tested before testing starts for use as staging areas. Provide traffic control for all profile testing.

The Engineer or MTRB or both may cancel the profile testing if the test area is not sufficiently clean, traffic control is unsatisfactory, or the area is not a safe work environment or test area does not meet Contract Document requirements. This canceled profile test will count as one profile test.

- (Q) Cost of Acceptance Profile Testing by The Department. The Engineer, MTRB, or State's Third-Party Consultant will perform one initial profile test, at no cost to the Contractor for each area to be tested.
- 1139The Department's High-Speed Inertial Profiler pavement profile will be1140used to determine if the pavement's profile, i.e., smoothness is acceptable.

1166 1167

1168

1178

1184

1142If the profile of the pavement does not meet the requirements of the1143Contract Documents, the Contractor shall perform remedial work, i.e.1144corrective work then retest the area to ensure that the area has the required1145MRI, i.e., smoothness, before requesting another profile test by the Engineer.1146

(1) Additional testing. Additional testing, by the Department beyond the initial test will be performed at cost to the Contractor as follows:

(a) \$2,500 per test will be required when Department personnel or State's Third-Party Consultant is used.

(R) Remedial Work for Pavements.

(1) Corrective work shall be required for any 25 ft interval with a localized roughness in excess of 160 in/mi. The Engineer may waive localized roughness requirements for deficiencies resulting from manholes or other similar appurtenances. Adjust manholes or other similar appurtenances so that using a 10-ft. straightedge the area around that manhole or other similar appurtenance shall not have more than 3/16-in. variation between any 2 contacts on the straightedge.

If corrective action is not successful, the Engineer may require continued corrective action, or apply a payment adjustment of \$250 per occurrence.

Corrective work shall also be required for any 0.1 mile interval 1169 (2) 1170 with an average MRI above 95.0 in/mi for Types A and B. For Type A, correct the deficient section to an MRI of 60 in/mi or less. For Type B, 1171 correct the deficient section to an MRI of 70 in/mi or less. For Type C, 1172 1173 corrective work may be required by the Engineer for 0.1 mile intervals that have an average MRI above the threshold shown in Tables 1174 401.03-4 - Smoothness Pay Disincentives With MRI and 401.03-5 -1175 1176 Smoothness Pay Disincentives For Percent Improvements as applicable. 1177

- 1179If corrective action does not produce the required improvement, the1180Engineer may require continued corrective action, or apply payment1181adjustment as shown in Tables 401.03-4 Smoothness Pay1182Disincentives With MRI and 401.03-5 Smoothness Pay Disincentives1183For Percent Improvements.
- 1185(3) The Contractor shall notify the Engineer at least 24 hours prior1186to commencement of the corrective work. The Contractor shall not

1187 commence corrective work until the methods and procedure have 1188 been approved in writing by the Engineer. 1189 1190 (4) All smoothness corrective work for areas of localized roughness shall be for the entire lane width. Pavement cross slope 1191 shall be maintained through corrective areas. 1192 1193 1194 The remedial repair areas shall be neat, rectangular areas (5) 1195 having a uniform surface appearance. 1196 1197 (6) If grinding is used on HMA pavement, the surface shall have 1198 nearly invisible grinding marks to passing motorist. 1199 1200 (7) Other methods may include milling and overlaying HMA pavement. The length, depth of the milling and the replacement 1201 1202 material will be solely decided by the Engineer. 1203 1204 The finished repaired pavement surface shall leave no ridges (8) 1205 or valleys or fins of pavement other than those allowed below. 1206 1207 Remedial repairs shall not leave any drainage structures' inlets (9) higher than the surrounding pavement or alter the Contract 1208 Document's drainage pattern. 1209 1210 1211 (10) For items in the pavement other than drainage structures, e.g., 1212 manhole frame and covers, survey monuments, expansion joints etc., the finish pavement, ground or not, shall not be more than 1/4 inch in 1213 elevation difference. Submit to the Engineer remedial repair method 1214 1215 to correct these conditions for acceptance. 1216 Pick up immediately grinding operation residue by using a 1217 (11) vacuum attached to grinding machine or other method acceptable to 1218 1219 the Engineer. 1220 1221 Any remaining residue shall be picked up before the end (a) of shift or before the area is open to traffic, whichever is earlier. 1222 1223 Prevent residue from flowing across pavement or from 1224 (b) 1225 being left on pavement surface or both. 1226 Residue shall not be allowed to enter the drainage 1227 (C) 1228 system. 1229 1230 The residue shall not be allowed to dry or remain on the (d) 1231 pavement. 1232

(e) Dispose of all material that is the result of the remedial repair operation, e.g., HMA residue, wastewater, and dust at a legal facility.

(12) Complete corrective work before determining pavement thickness for HMA pavements in accordance with Subsection 401.03(I) – HMA Pavement Thickness Tolerances.

(13) All HMA wearing surface areas that have been ground shall receive a coating, e.g., a coating material that will restore any lost impermeability of the HMA due to the grinding of the surface. The coating used shall not be picked up or tracked by passing vehicles or be degraded after a short period of time has passed, i.e., it shall have a service life equal to or greater than the HMA pavement. The coating shall not decrease the pavement's friction value. The coating's limits shall be the full width of the lane regardless how small. If the remedial repair area extends into the next lane, then the repair area will be full lane width also. Extend the length of coating areas in order for the coating area to look like the rest of the road and does not have patches on it, i.e., make the road look uniform in color. The coating shall be of a color that matches the surrounding pavement. The areas receiving the coating shall not be open to traffic until it has cured enough so that it cannot be picked up or tracked by passing vehicles or degrade. Submit means and methods of the coating and type of coating to the Engineer or MTRB for review and acceptance. Do not proceed with the coating without acceptance from the Engineer.

(14) Recompacting cold HMA, i.e., HMA that has reached ambient temperature is not an acceptable remedial repair method.

(15) Replace all pavement markings damaged or discolored by remedial repairs.

(16) Reprofile the corrected area and provide the Engineer the results that show the corrective action, i.e., remedial repairs were successful.

(S) Pavement Smoothness and Acceptance.

(1) Price and payment in various paving sections, e.g., 401 (Hot Mix Asphalt Pavement), shall be full compensation for all work and materials specified in the various paving sections and this section, including but not limited to furnishing all labor, materials, tools, equipment, testing, incidentals and for doing all work involved in micro milling, milling (cold planing), grinding existing or new pavement, removing residue, cleaning the pavement, necessary disposal of

1279residue, furnishing of any water or air used in cleaning the pavement1280and any other related ancillary work or material or services. Also, it1281includes any remedial work, e.g., re-paving, surface grinding,1282application of a coating, curing compound, and replacement of1283damaged pavement markings.1284

1285(2) The contract price in those sections may be adjusted for1286pavement smoothness by the Engineer. The pavement smoothness1287contract unit price adjustments and work acceptance will be made in1288accordance with the following schedules.1289

IADEE	TABLE 401.03-3 - SMOOTHNESS PAY INCENTIVES		
Category	MRI (in/mi)	Pay Adjustment \$ per 0.1 mi	
	<30.0	\$580	
	30.0- less than 35.0	\$480	
	35.0- less than 40.0	\$380	
Туре А	40.0- less than 45.0	\$280	
	45.0- less than 50.0	\$180	
	50.0- less than 55.0	\$80	
	55.0- less than 60.0	\$0	
	<35.0	\$420	
	35.0- less than 40.0	\$360	
	40.0- less than 45.0	\$300	
Туре В	45.0- less than 50.0	\$240	
51	50.0- less than 55.0	\$180	
	55.0- less than 60.0	\$120	
	60.0- less than 65.0	\$60	
	65.0- less than 70.0	\$0	
	<40.0	\$280	
	40.0- less than 45.0	\$240	
	45.0- less than 50.0	\$200	
Type C	50.0- less than 55.0	\$160	
71 -	55.0- less than 60.0	\$120	
	60.0- less than 65.0	\$80	
	65.0- less than 70.0	\$40	
	70.0- less than 75.0	\$0	

(3) Pay Pavement Smoothness Adjustment will be based on the initial measured MRI for both left and right wheel path, <u>prior to any</u> corrective work for the 0.10-mile section, except for sections that the Contractor has chosen to remove and replace. For sections that are replaced, assessments will be based on the MRI determined after replacement.

(a) The Pavement Smoothness Adjustment will be computed using the plan surface area of pavement shown in the Contract Documents. This Pavement Smoothness Adjustment will apply to the total area of the 0.10-mile section for the lane width represented by MRI for the same lane. It does not include any other price adjustments specified in the Contract Documents. Those price adjustments will be, for each adjustment, calculated separately using the original contract price to determine the amount of adjustment to be made to the contract price. Sections shorter than 0.1 mile and longer than 50 feet shall be prorated.

(b) For 0.1 mile intervals with an average MRI above the threshold shown in Table 401.03-3 – Smoothens Pay Incentives, the Engineer shall apply a disincentive payment adjustment up to the limit shown.

- i. For Types A and B, payment adjustments shall be applied up to an MRI of 95.0 per Table 401.03-4 -Smoothness pay Disincentives With MRI.
- ii. For Type C, the payment adjustment shall be dependent on the average MRI of the pavement prior to paving activities
 - If the MRI of the pavement prior to paving activities is 125.0 in/mi or less, the payment adjustment shall be per Table 401.03-4 -Smoothness pay Disincentives With MRI.
 - If the MRI of the pavement prior to paving activities is more than 125.0 in/mi, the disincentive payment adjustment shall be per Table 401.03-5 - Smoothness Pay Disincentives For Percent Improvements, and based on the percent improvement using the following formula:

% Improvement = (Initial segment MRI – Final segment MRI) x 100 / (Initial Segment MRI)

1343 1344

1345

1346 1347 (c) Incentives will not apply to areas where payment deductions or remedial repairs has been made for non-compliant work, e.g., low compaction, thin pavement, thermal segregation, low compressive or flexural strength, non-compliant alignment. Incentives will also not apply to areas where corrective work was required to meet contract smoothness requirements, unless the pavement section was replaced. All areas where corrective work was performed shall 1348be tested again to ensure the smoothness requirements are1349met.1350

(d) There will be no incentive price adjustments to the contract prices regardless of the pavement meeting the Contract Documents' requirements for incentive contract price adjustment, when 25% of the total area paved of that particular type of pavement on the project has failed to meet any of the Contract document requirements, e.g., smoothness, thickness, unit weight, asphalt content, pavement defects, compaction, flexural or compressive strength. Areas exempt from the smoothness requirements may not be included in the total area calculation unless it is non-compliant.

(e) For contracts using lump sum the method described in Subsection 104.06 Methods of Price Adjustment paragraph (3), will be used to calculated proportionate unit price, i.e., the Engineer's calculated theoretical unit price. This calculated proportionate unit price will be used to calculate the unit price adjustment.

401.04 Measurement.

- 1371(A) The Engineer will measure PMA pavement per ton in accordance with1372the Contract Documents.
- (B) Engineer will measure additional State pavement profiling work when applicable on a cost-plus basis as specified in this section and as ordered by Engineer. The Engineer will issue a billing for the pavement profile work done for the time period with the invoices and receipts that the billing was based on attached to the Contractor for each contract item. The Contractor's pavement profile work required in this section will not be measured and will be considered incidental to the various paving items unless stated otherwise.
- 1382401.05Payment. The Engineer will pay for the accepted PMA pavement at the1383contract price per pay unit, as shown in the proposal schedule. Payment will be full1384compensation for the work prescribed in this section and the contract documents.
- (A) Price and payment in Section 401 – PMA Pavement will be full compensation for all work and materials specified in this Section including furnishing all labor, materials, tools, equipment, testing, pavement profiles and incidentals and for doing all work involved in grinding existing or new pavement, removing residue, and cleaning the pavement, including necessary disposal of residue and furnishing any water or air used in cleaning the pavement and remedial work needed to conform to the requirements of the Contract Documents.

1394	
1395	(B) No payment for the Contractor's pavement profile work required in this
1395	section will be made. The Contractor's pavement profile work shall be
1390	considered incidental to the various paving items unless stated otherwise.
	considered incidental to the various paving items unless stated otherwise.
1398	
1399	(C) Engineer will pay or deduct for the following pay items when included
1400	in proposal schedule:
1401	Devident Devide
1402	Pay Item Pay Unit
1403	
1404	Pavement Smoothness Incentive Allowance
1405	
1406	PMA Pavement, Mix No Ton
1407	
1408	(1) 70% of the contract unit price or the theoretical calculated unit
1409	price upon completion of submitting a job-mix formula acceptable to
1410	the Engineer; preparing the surface, spreading, and finishing the
1411	mixture; and compacting the mixture.
1412	
1413	(2) 20% of the contract unit price or the theoretical calculated unit
1414	price upon completion of cutting samples from the compacted
1415	pavement for testing; placing and compacting the sampled area with
1416	new material conforming to the surrounding area; protecting the
1417	pavement; and compaction acceptance. Maintain temporary
1418	pavement markings and other temporary work zone items, maintain a
1419	clean work site.
1420	(2) $10^{0/2}$ of the contract unit price or colculate the unit price when
1421 1422	(3) 10% of the contract unit price or calculate the unit price when the final configuration of the pavement markings is in place.
1422	the final configuration of the pavement markings is in place.
1423	The Engineer will pay for adjusting existing frames and covers and valve
1425	boxes in accordance with and under Section 604 – Manholes, Inlets and Catch
1426	Basins. Adjustments for existing street survey monument frames and covers will be
1420	paid for as if each were a valve box frame and cover.
1428	
1429	The Engineer may, at his sole discretion, use the sliding scale factor as
1429	specified in Table 401.05-1 – Sliding Scale Pay Factor for Compaction to accept
1430	HMA pavements compacted between 90.0 percent and 98.0 percent. If the sliding
1432	scale factor is used, the Engineer will make payment for the material in that
1432	production day at a reduced price by multiplying the contract unit price by the pay
1434	factor. The Engineer is not obligated to allow non-compliant work to remain in place
1435	and may choose to require removal of the pavement that is less than 93.0 percent
1435	or greater than 97.0 percent.
1430	
1437	Removal of non-compliant pavement shall be in accordance with Subsection
1/20	105 12 Removal of Non Conforming and Unauthorized Work

1439 105.12 Removal of Non-Conforming and Unauthorized Work.

Table 401.05-1 – Sliding Scale Pay Factor for Compaction		
Percent Compaction	Percent of Quantity Paid	
> 98.0	Removal	
>97.0 - 98.0	95	
93.0- 97.0	100	
90.0 - <93.0	80	
<90.0	Removal	

1442
