

1 Make the following Section a part of the Standard Specifications:
2

3 **“SECTION 577 – FIBER REINFORCED POLYMER SYSTEMS**
4

5 **577.01 Description.** The work includes the furnishing of all materials,
6 labor, equipment and services for the supply, installation and finish of all
7 structural strengthening using externally bonded FRP systems.
8

9 **577.02 Materials.** Materials for the FRP systems shall be carbon fiber and
10 conform to ACI 440.2R, Guide for the Design and Construction of Externally
11 Bonded FRP Systems for Strengthening Concrete Structures and the AASHTO
12 2012 Guide Specifications for Design of Bonded FRP Systems for Repair and
13 Strengthening of Concrete Bridge Elements. In addition, the materials shall
14 conform to the following minimum properties:
15

16 **(A) Dry Fiber Properties**
17

18 Tensile Strength – 580,000psi
19

20 **(a)** Tensile Modulus – 33.4×10^6 psi
21

22 **(b)** Ultimate Elongation – 1.7%
23

24 **(B) Composite Gross Laminate Properties of one layer**
25

26 **(1)** Tensile Strength – 143,000 psi ASTM D3039
27

28 **(2)** Tensile Modulus – 13.9×10^6 psi – ASTM D3039
29

30 **(3)** Elongation Break – 1.0% - ASTM D3039
31

32 **(4)** Nominal Laminate Thickness – 0.08 in. as noted on the
33 plans in accordance with ASTM D1777
34

35 Alternatively, provide a system with an equivalent E x A as shown on the plans.
36 Submit calculations by a licensed Hawaii Structural Engineer and supporting
37 documentation for the alternative design to the Engineer for review and approval.
38

39 **577.03 Construction.**
40

41 **(A) Submittals.**
42

43 **(1)** Manufacturer's manual indicating product standards,
44 physical and chemical characteristics, technical specifications,
45 limitations, installation instructions, maintenance instructions and
46 general recommendations regarding each individual material.
47

48 **(2)** A list of surface bonded FRP composite strengthening
49 projects completed by the subcontractor using the selected
50 supplier's FRP system in the last 3 years. The list should include at

a minimum 5 projects proposed FRP system, the dates of work, description and amount of work.

(3) A list of no fewer than 10 successful installations by certified applicator with written consent from manufacturer that the Contractor has been trained. The certified applicator for this project FRP system shall prove a minimum of 5 years of experience in performing retrofits using FRP systems.

(4) Shop drawings detailing the type, locations, dimensions, numbers of layers, and orientation of all FRP materials and coatings to be installed. Design shall follow criteria in ACI 440.2R.

(5) Manufacturer's product data sheets indicating physical, mechanical, and chemical characteristics of all materials used in the FRP system. Data sheets to also include properties of the cured FRP laminates as determined by laboratory testing in accordance with ASTM D7565 and/or ASTM D3039 (ultimate and design tensile modulus, stress and strain). Certification that the durability tests conform to ACI 440R and ACI 440.2R.

(6) Manufacturer's Material Safety Data Sheets (MSDS) for all materials to be used.

(7) Certification by the manufacturer that supplied products comply with local regulations controlling use of volatile organic compounds (VOC's). Products that require the use of respirators do not comply with local regulations controlling use of VOC's and shall not be allowed.

(8) Submit durability test results for physical and mechanical properties as outlined in the AASHTO Guide Specifications for Design of Bonded FRP Systems for Repair, Section C2.2.4.4 with the exception of the Freeze-Thaw testing.

(9) Submit paint manufacturer's paint product data information with proposed paint color and sheen.

(B) Surface Preparation.

(1) "Contact Critical" Applications:

(a) The surface to receive the composite shall be free from fins, sharp edges and protrusions that will cause voids behind the installed casing or that, in the opinion of the Engineer will damage the fibers. Existing uneven surfaces to receive composite shall be filled with the system epoxy filler or other material approved by the Engineer. The contact surfaces shall have no free moisture on them at the time of application. If moisture is present, use the manufacturer suggested wet prime epoxy, if available.

(b) Repair all damaged concrete, spalls, and irregular surfaces to create a flat, or slightly convex, surface. Fill surfaces with thickened epoxy to eliminate air surface voids greater than 0.5 inch diameter.

(c) Round off sharp and chamfered corners to a minimum radius of 0.75 inch or as otherwise noted on the plans by means of grinding or forming with the system's thickened epoxy. Variations in the radius along the vertical edge shall not exceed 0.5 inch for each 12 inch of column height.

(2) **"Bond-Critical" Applications:**

(a) Surface preparation shall be in accordance with recommendations of ACI 546R and ICRI 03730.

(b) Prepare surface to receive composite to a concrete surface profile (CSP) 3 in accordance with the ICRI examples.

(c) Pressure inject any cracks larger than 0.010 inch wide with epoxy.

(d) All substrates shall be clean, sound, and free of surface moisture. Remove dust, laitance, grease, curing compounds, waxes, impregnations, foreign particles, and other bond inhibiting materials from the surface by blast cleaning or other mechanical means. All contact surfaces shall then be cleaned by hand or compressed air within 24 hours prior to receiving FRP repair.

(3) Contractor shall prepare a sample area of each type of application for acceptance by the Engineer prior to commencing with application work.

(C) **Installation.** Construction of the FRP system shall conform to ACI 440.2R-08. A representative of the FRP system manufacturer shall initially and periodically observe and monitor all aspects of preparation mixing, and application of materials.

(1) Prepare the epoxy matrix by combining components at a weight (or volume) ratio specified by the manufacturer. The components of epoxy resin shall be mixed with a mechanical mixer until uniformly mixed, typically 5 minutes at 400-600 revolutions per minute.

(2) Saturation of the carbon fiber fabric shall be performed and monitored according to the manufacturer's specified fiber-epoxy resin ratio. Fabric shall be completely saturated prior to application to contact surface in order to ensure complete impregnation. Saturation shall be supervised and checked

153 by the certified installer. Both the epoxy resin and fabric
154 shall be measured accurately, combined, and applied
155 uniformly at the rates shown on the approved working
156 drawings and per manufacturer's recommendations.

157
158 (3) After preparing surfaces, use a roller or trowel to apply one
159 prime coat of epoxy resin to the substrate (2 mil min.). Allow
160 primer to become tacky to the touch.

161
162 (4) Fill any uneven surfaces or recesses with thickened epoxy.

163
164 (5) Apply saturated fabric to substrate surface by hand lay-up,
165 using methods that produce a uniform, constant tensile force
166 that is distributed across the entire width of the fabric, and
167 ensure proper orientation of the fabric. Under certain
168 application conditions, the system may be placed entirely by
169 hand methods assuring a uniform, even final appearance.
170 Gaps between composite bands may not exceed 0.5 inch
171 width in the fabric's transverse joint unless otherwise noted
172 on project drawings. A lap length of at least 6 inches per ply
173 is required at all necessary overlaps in the primary fiber
174 direction of the fabric.

175
176 (6) Orient fabric as designated by the designer. Fabric
177 alignment shall not exceed 3 degrees misalignment from
178 planned alignment.

179
180 (7) Apply subsequent layers, continuously or spliced, until
181 designed number of layers is achieved, per shop drawings.

182
183 (8) Use a roller or hand pressure to release or roll out entrapped
184 air, and ensure that each individual layer is firmly embedded
185 and adhered to the preceding layer or substrate.

186
187 (9) Detail all fabric edges, including termination points and
188 edges, with thickened epoxy.

189
190 (10) Feather all edges and seams. Finish, as specified below,
191 between 24 and 72 hours after final application of epoxy. If
192 finish is provided beyond 72 hours of the application of the
193 epoxy, the surface must be roughened by hand sanding or
194 brush blasting, prior to finishing. The finish shall be
195 thickened epoxy with coarse to medium broadcast clean, dry
196 silica sand or two coats of acrylic paint, furnished by the FRP
197 system manufacturer, with an approximate dry film thickness
198 of 4 mils. Color will be determined by Engineer.

199
200 (11) Protect the FRP system from environment contamination,
201 disturbance and damage during application and curing of the
202 system
203

- (12) Ambient and substrate temperature shall be between 40° F to 100° F during installation.

(D) Inspection and Testing

- (1) Monitor and record the mixing of all epoxy components for proper ratio and adherence to manufacturer's recommendations, batch numbers for fabric and epoxy used each day, and note locations of installation. Measure square footage of fabric and volume of epoxy used each day. Submit report to the Engineer.
- (2) Direct tension adhesion testing shall be conducted using the method described by ASTM D7522 and/or ASTM D4541. A minimum of two tests shall be performed for each day's work area or for every 500 square feet of surface area to be covered by the FRP application, whichever is smaller. Pull-off tests shall be performed on a representative adjacent area to the area being strengthened whenever possible. Tests shall be performed on each type of substrate or for each surface preparation technique used.
- (3) The epoxy bonded to the prepared surface shall be allowed to cure as per manufacturer's requirements before execution of the direct tension pull-off test. The locations of the pull-off tests shall be representative and on flat surfaces. If no adjacent areas exist, the tests shall be conducted on areas of the installed FRP system subjected to relatively low stress during service.
- (4) The minimum acceptable value for any pull-off test is 175 pounds per square inch. The average of the tests shall not be less than 200 pounds per square inch. Additional tests may be performed to qualify the work at each identified area. Each pull-off test is to exhibit a failure mode in the substrate and not the epoxy-to-substrate bond plane.
- (5) ASTM D7522-D4541 testing is only required for "Bond-Critical" applications of the FRP system (i.e. bond of FRP-to-concrete is critical to strengthening performance of the system)
- (6) Prepare a minimum of one "sample batch" daily consisting of two 12 inch by 12 inch samples of cured composite. Each sample of the "sample batch" will be taken at appropriate times during the day as to ensure the maximum material deviance in the components of the FRP composite.
- (7) Prepare sample on a smooth, flat, level, surface covered with polyethylene sheeting, or 16 mil plastic film, prime with epoxy resin. Then place one layer of saturated fabric and

255 apply additional topping of epoxy. Cover with plastic film
256 and squeegee out all bubbles. Samples shall be stored in a
257 sample box and not moved for a minimum 48 hours after
258 casting. The prepared, identified samples shall be given to a
259 pre-approved and experienced independent testing
260 laboratory approved by the Engineer. The laboratory shall
261 then precondition samples for 48 hours at 140° F before
262 testing.
263

264 (8) A minimum of fifteen-percent of all 12-inch-by-12-inch
265 sample panels shall be tested by the laboratory approved by
266 the Engineer. Testing specimens shall be cut from samples
267 and tested for ultimate tensile strength, tensile modulus and
268 percentage elongation as per ASTM D7565 and/or ASTM
269 D3039 in the longitudinal fiber direction. Tensile and all
270 other material properties must meet or exceed FRP
271 composite system properties as required by structural
272 calculations. If one coupon does not achieve the design
273 properties, additional coupons from the same sample shall
274 be tested. If these coupons fail (on average), coupons from
275 the other 12-inch-by-12-inch sample, from the same batch
276 for that day, shall be tested. If all tested samples of the
277 sample batch do not meet the conditions of acceptance, 25
278 percent of all samples shall be tested. Testing results shall
279 be submitted to the Engineer not later than three weeks after
280 testing.
281

282 (9) FRP design values must be lower than the calculated mean
283 determined from the test results received from the ASTM
284 D7565 and/or ASTM D3039 field test specimens.
285 Acceptable minimum values for ultimate tensile strength,
286 tensile modulus, and elongation shall not be below the
287 submitted design values unless calculations are performed
288 using the tested values that exhibit an acceptable capacity
289 as per the original design demands and concept. Small
290 voids and bubbles on the order of 3 inch diameter and voids
291 and delaminations on the order of 6 inches in diameter or an
292 area of 5 inch x 5 inch shall require remediation prior to
293 acceptance by the Engineer.
294

295 (E) **Repair of Defective Concrete.** Contractor shall submit a repair
296 plan which gives the locations and types of defective work. The plan shall
297 propose repair procedures and materials for each type of work. The plan
298 will be accepted by the Engineer prior to commencing with repair works.
299 Repairs shall meet accepted industry standards for each type of defect
300 and equal or exceed the values of the designed strengthening.
301

302 (F) **Painting.** Finished FRP surface shall be painted with an acrylic,
303 polyurethane, or high solids epoxy paint as recommended by FRP
304 manufacturer. Prior to painting, FRP shall be cleaned and prepared
305 according to manufacturer's recommendations. Color of paint shall be

306 similar to that of the portland-cement concrete in the adjacent components
307 and shall be approved by the Engineer.
308

309 Complete a paint test section of a minimum 6 square feet for acceptance
310 by the Engineer. Redo test section until accepted by Engineer.
311 Production finish shall closely match test section.
312

313 **577.04 Measurement.** The Engineer will pay the fiber reinforced
314 polymer (FRP) systems per square foot. FRP systems quantity is calculated
315 based on the area of FRP required, multiplied by the number of layers required.
316

317 **577.05 Payment.** The Engineer will pay for the accepted FRP systems
318 at the contract unit price per square foot, complete in place. Payment will be full
319 compensation for work prescribed in this section and the contract documents.
320

321 The Engineer will pay for the following pay item when included in the
322 proposal schedule:
323

324	Pay Item	Pay Unit
325		
326	Fiber Reinforced Polymer (FRP) Systems	Square Feet"
327		
328		
329		
330		

END OF SECTION 577
