LOCATION PLAN

Scale: 1"=40'

ESTIMATED QUANTITIES

Concrete	Lump Sum	(850.0 c.y.)
Reinforcing Steel	Lump Sum	(202,543.0 lbs.)
Structural Excavation	139.0	c.y.
Asphaltic Concrete Paving	116.0	Tons
Bituminous Tack Coat	135.0	Gals.
Metal Railing	332.0	Lin. Ft.
Bronze ℄	668.0	lbs.

GENERAL NOTES

DESIGN DATA

H 20-S16-44 Loading
fs = 20,000 p.s.i.
fc = 1,200 p.s.i.
n = 10

MATERIALS

All concrete shall be class A-1 unless otherwise noted on plans.
All steel reinforcement shall be intermediate grade

CONSTRUCTION METHODS

Curb and Sidewalk on Bridge shall not be poured until after release of Falsework

All surfaces of railing parapets and end posts above sidewalk level, all other surfaces seen in elevation, all columns above curb level and all exposed surfaces of Abutment walls and retaining walls shall be given "Class 2 Surface Finish."

Footings shall be poured to neat lines as shown. In case of over excavation, space between footing and ground shall be filled with concrete at the Contractors expense. This fill concrete shall have a minimum quality of "Class D-1".

Reinforcing cover- Deck Slab 1¼" minimum. Abutment Walls, Retaining Walls and Columns 2" Minimum. Footings 3" minimum.

Falsework and Forms for the support of Box Girders shall be designed to support the load that would be superimposed were the entire superstructure poured at one time. Falsework and forms supporting the bottom slab of box girders shall not be removed until 14 days after the final top slab pour. All interior forms except those permitted to remain in place shall be removed completely and the inside cleared of all loose material and swept clean. Forms for bottom slab of Box Girder shall be 5 Ply panel board.

Refer to Standard Detailed drawing sheets "S-1, "S-2, "S-3, "S-4, & "S-5 for details not covered by these drawings.

SHEET REFERENCE

All reference to sheets concerning Structure No.1 Details are confined only to Structure No.1 Plans, sht. 1 through sht. 13, or to the Standard Details, sht. S-1 through sht. S-5, except where reference is made to "Plan Sheet No. ____" which refers to consecutive numbering of sheets of the entire Contract Plans.

Revised: July 16, 1965

GENERAL NOTES

SPECIFICATIONS: AASHO
Standard Specifications for Highway Bridges (8th Edition) with subsequent additions and modifications.

DESIGN LOADS:
HS 20-44 as defined in design specifications.

DESIGN STRESSES:
1. See AASHO specifications except as otherwise noted and see Special Provisions.
2. Prestressed Girders
f'_c = 6000 psi after 28 days
f'_{ci} = 4000 psi at time of releasing prestressed strands.
½" diameter 7 wire strands.
Forms must be removed and beams inspected before strands are cut.
3. Pile Bearing Capacity: 32 Tons at abuts. and 45 Tons at pier.

MATERIALS:
1. All concrete shall be class A-1 except as otherwise noted on Plans. Concrete for prestressed concrete girders - see Special Provisions and as noted above.
2. Neoprene pads are incidental to prestressed concrete girders and will not be paid for separately.
3. See Special Provisions for Admixture in concrete.

CONSTRUCTION METHODS:
1. See Standard Specifications and Special Provisions.
2. The Contractor shall verify the location of all existing utility lines and notify the respective owners before commencing excavation or pile driving.
3. All fill behind abutments and ret. walls shall be complete in place before placing prestressed girders and pouring concrete for the superstructure.
4. For concrete finish see Special Provisions.
5. Neoprene pads shall be secured against displacement by adhesives. The adhesives used shall be approved by the Engineer.
6. Refer to Standard Detailed Drawing sheets #S-1, #S-2 - #S-3, #S-4 & #S-5 for details not covered by these drawings.
7. All reference to sheets concerning Structure N° 2 Details are confined only to Structure N° 2 plans, sheets #1 through #11 or to the Standard Details, sheets S-1 thru S-5, except where reference is made to "Plan Sheet N° ___" which refers to consecutive numbering of sheets of the entire Contract Plans.

GENERAL NOTES

FED. ROAD DIST. NO.	STATE	FED. AID PROJ. NO.	FISCAL YEAR	SHEET NO.	TOTAL SHEETS
HAWAII	HAW.	FHH(D)24, Unit 2	1965	C0172	276

Revision No. 1 - Change Abutment #1 & #2 Retaining Wall #2 & Estimated Quantities.

DESIGN SPECIFICATIONS: Design is in accordance with AASHO Standard Specifications for Highway Bridges. (Eighth Edition).

DESIGN LOADS: H20-S16-44 as defined in specifications.

DESIGN STRESSES:

f'_c = 3000 p.s.i.	4,500 p.s.i.
f_c = 1,200 p.s.i.	1,800 p.s.i.
n = 10	8
f_s = 20,000 p.s.i. - tension	

MATERIALS:

1. All concrete shall be Class A-1 unless otherwise noted on plans.
2. Concrete clear cover for reinforcing bars shall be as follows unless noted otherwise:
   1½" for stirrups on sides of beams
   2½" to main reinforcing of pier caps | 2 5/8" to main reinforcing of column.
   2" for formed walls | 3" for footings.
3. Concrete seats receiving steel plates, lead plates or neoprene pads shall be poured monolithically with supporting structures and top surfaces of the concrete seats shall be finished with a steel trowel to a smooth level surface at the elevation shown on the plan.
4. Reinforcing bars shall be detailed in accordance with A.C.I. "Manual of Standard Practice for Detailing Reinforced Concrete Highway Structures" unless otherwise noted.
5. Reinforcing bars shall be securely tied at all intersections and lap splices, and shall be held in place during pouring to maintain their proper locations as shown on plans.
6. All splices for deck and pier cap reinforcing bars larger than #11 shall be butt welded. See Std. Details.
7. All reinforcing steel to be ASTM Designation A15 Billet steel, intermediate grade, except as otherwise noted.

CONSTRUCTION METHODS:

1. Shop placement and detail drawings for all reinforcing steel in deck are required. Splices for continuous slab strip bars shall be located near midspan for top slab and near pier support for bottom slab. All splices shall be staggered.
2. Sides of footings shall be excavated and poured to neat lines when called for on the plans. For excavation of bottom of footings, see Standard Specifications. Over excavation beyond neat lines for sides of footings and the elevations indicated on the plans for the bottom of footings shall be backfilled with a minimum of Class D concrete at the Contractor's expense and as directed by the Engineer.
3. All backfill behind abutments shall be complete in place before placing of superstructure.
4. Forms for all exposed surfaces of separation structures including retaining walls (except round columns) shall be plywood. Forms for round columns shall be made of material that results in a smooth finish and true dimensions as shown in the plans.
5. Concrete finish - see Standard Specifications and for Special Provisions.
6. All welding shall conform to the latest Specifications for Welded Highway and Railway Bridge Design, Construction and Repair of the American Welding Society.
7. Vert.. Col. bars shall be arranged in such a manner as to miss Pier Cap reinf above.
8. In general, top of concrete deck of structure shall be constructed to follow the finish roadway vertical and horizontal curves and grades.

CAMBER: Obtain camber by forming and shoring concrete surfaces above profile grades amount shown in camber diagram and as indicated on detailed drawings

REFERENCE:

Typical details as shown on sheets #62, #63, #64, & #65 refer to the structure except for modifications as may be required for special conditions. For such modifications see corresponding detailed drawings.

Refer to Standard Detailed drawing sheets #51, #52, #53, #54 & #55 for details not covered by these drawings.

GENERAL:

In general, all elevations, stations and locations of existing Abutment #3 and supporting structure shall be verified in the field before commencing with the new work.
The contractor shall verify the location of all existing utility lines.
The contractor shall furnish shop placement and detail drawings for all structural steel work including bearings and Frame & Grating Assemblage for deck drains.

REFERENCE OF SHEETS:

All reference to sheets concerning Structure N°3 Details are confined only to Structure N°3 Plans, sheet 1 through sheet 67 or to the standard Details sheet S-1 through sheet S-8, except where reference is made "Plan Sheet No." which refer to consecutive numbering of sheets of the entire Contract Plans.

TOP SLAB PLAN SHOWING LIMITS of VARIOUS SPECIAL TREATMENT of DECK TRANSVERSE REINFORCEMENT

Scale 1"=20'-0"

In General all deck transverse bars to be placed normal to the outbound ℄ for main structure and ℄ Ramp HI-1 for ramp structure. For longitudinal reinforcement layout - See corresponding bar placement diagrams and normal deck sections.

Note:

Shaded vertically hatched areas denote limits of special Transverse Top Slab Reinforcement. Within this area, typical bent up transverse bars shall be extended along top layer to end of slab, and added bottom straight bars shall be placed alternately with continuous straight bars. See Typical Section Sht # 62

For Limits and Arrangement of Special Reinforcements at Skewed ends, see Typical Detail Sht. # 62

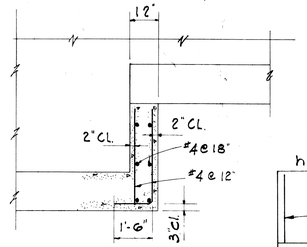
SECT. A-A

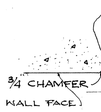


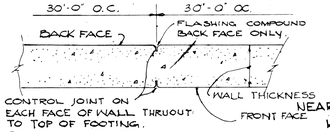
SECTION B-B

STEPPED FTG. DET.

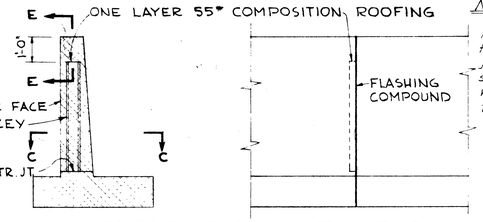
SCALE: 3/8" = 1'-0"

JOINT MAY BE FORMED WITH 1/8" MASONITE AND CUT BACK TO THE ROOT OF THE CHAMBER ON THE EXPOSE FACE.



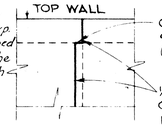


ALTERNATE CONTRACTION JOINT DETAIL



JOINT ELEVATION

NOTE:
For ret walls with bridge railing, spacing for contr. joint and exp. joint shall be determined so that the joints in the wall will coincide with the joints in railing.



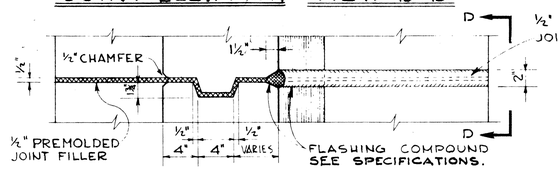
SECT. E-E

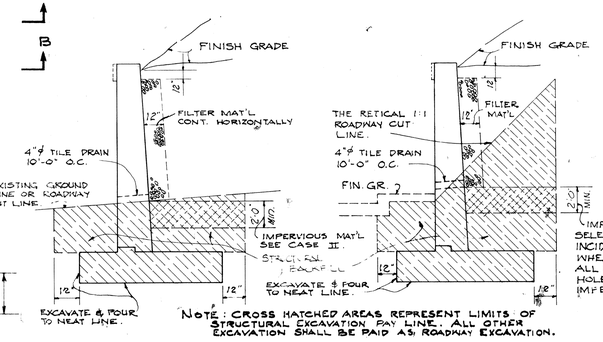
NOTE:
In lieu of the composition roofing for contraction joint, the surface may be cleaned smooth and coated with bond breaking material.

(SPACING OF JOINTS)
CONTRACTION JOINT - 30'-0" MAX.
EXPANSION JOINT - 90'-0" MAX.

NOTE:
CONTRACTION JOINT IS SIMILAR TO EXPANSION JOINT EXCEPT THAT ONE LAYER OF 55# COMPOSITION ROOFING SHALL BE USED IN PLACE OF PREMOLDED JOINT FILLER AND THE JOINT SHALL EXTEND THRU THE STEM ONLY.

VIEW D-D





NOTE: CROSS HATCHED AREAS REPRESENT LIMITS OF STRUCTURAL EXCAVATION PAY LINE. ALL OTHER EXCAVATION SHALL BE PAID AS ROADWAY EXCAVATION.

IMPERVIOUS MATERIAL AS SELECTED BY THE ENGINEER INCIDENTAL TO STRUCT. EXC. WHEN "H" IS 2'-0" OR LESS ALL BACKFILL BELOW WEEP-HOLE LEVEL SHALL BE IMPERVIOUS MATERIAL.

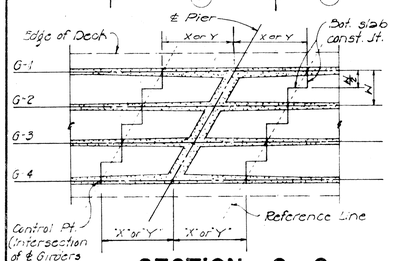
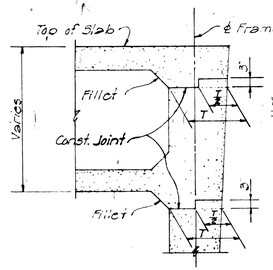
No. 1 - Numbers (1) & (2) indicate sequence of placing bottom slab & girder stem concrete. (2) may be placed simultaneously with (1) when approved by the Engr., and provided that the (1) sections are placed in adjoining spans. For any deviation from the above the contractor shall submit a diagram to the Engineer for approval.
No. 2 - No top slab construction joint or form removal opening shall be located in the region over the piers as noted.
No. 3 - When top slab forms are not removed, const. joint in top slab shall be located over an intermediate diaphragm.
No. 4 - Dimension "X" = 1/4 span "Y" = 1/5 span
No. 5 - No lapping of main girder bars shall be permitted at construction joints.

PLACING DIAGRAM FOR SUPERSTRUCTURE CONCRETE

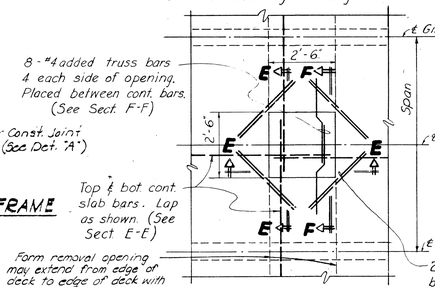


SECTION C-C
SHOWING TREATMENT OF CONST. JOINT FOR BRIDGES ON SKEW

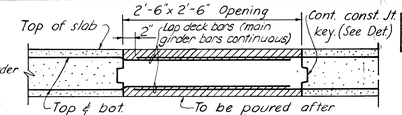


DETAIL - A

Note: Final location of opening shall be determined by the Engineer.

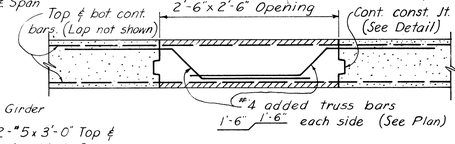


PART PLAN - DECK
SHOWING FORM REMOVAL OPENING

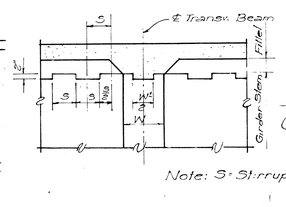


SECTION E-E

Note: Form removal opening at top slab shall not be located where main girder bars occur.

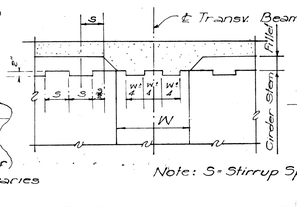


SECTION F-F



Note: S = Stirrup Spacing

SECTION - BEAM WIDTH LESS THAN 2'-0" PLAN

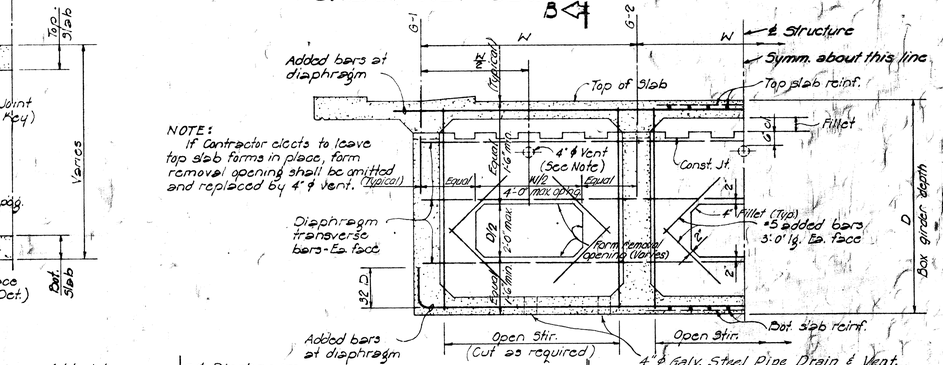


Note: S = Stirrup Spacing

SECTION - BEAM WIDTH MORE THAN 2'-0" PLAN

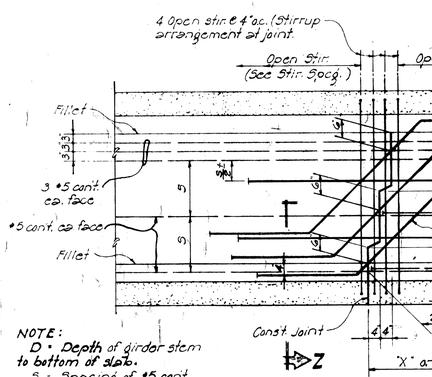
NOTE: Shear keys for box girders may be eliminated if the entire surface of the joint is thoroughly cleaned of surface laitance, curing compound and other materials foreign to the concrete, and clean aggregate is exposed by abrasive blast cleaning after the curing period or immediately before placing concrete of the joint.

SHEAR KEY DETAIL



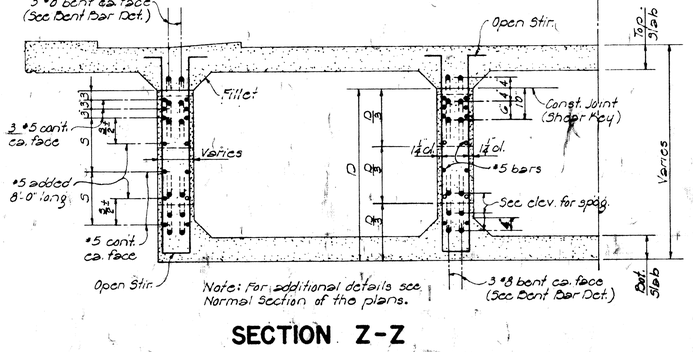
NOTE: If Contractor elects to leave top slab forms in place, form removal opening shall be omitted and replaced by 4" ℄ Vent. (Typical)

FORM REMOVAL OPENING DETAIL IN DIAPHRAGM

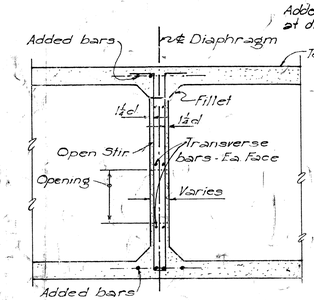


NOTE:
D = Depth of girder stem to bottom of slab.
S = Spacing of #5 cont. girder stem long. bars.

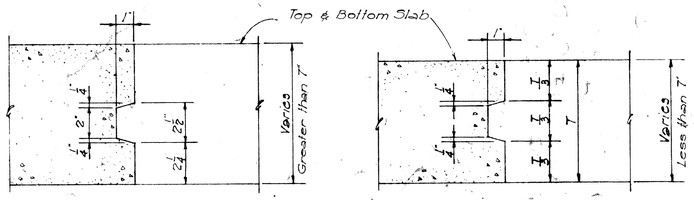
GIRDER STEM CONST. JOINT



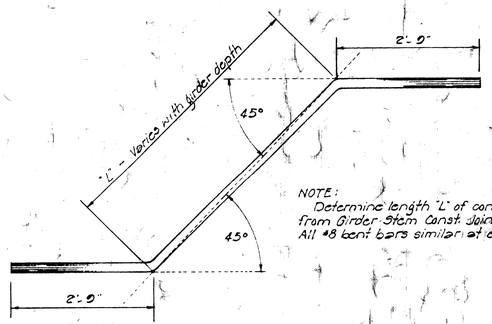
SECTION Z-Z



SECTION B-B



TOP AND BOTTOM SLAB CONST. JOINT



NOTE: Determine length "L" of control bar from Girder Stem Const. Joint detail. All #8 bent bars similar at each joint.

BUILD-UP WITHOUT DRIVING

Note:
Concrete in pile build-ups without driving shall be class A-1 concrete. Concrete in pile build-ups with driving shall have a minimum compressive cylinder strength f'_c of 5000 p.s.i. at 28 days. Build-ups may be driven if the specimen of concrete from which the piles were poured develops a strength of at least 3500 p.s.i. but not earlier than 7 days.

The minimum area of reinforcing steel shall be 1½% of the gross cross-section of concrete. Placement of bars shall be in a symmetrical pattern of not less than four bars.

#3 Gage wire spiral ties.

2" Clear cover

Concrete around top edge of pile shall be bushhammered to prevent feather edges.

GENERAL NOTES

1 - Class of concrete to be used in different parts of the structure are as noted on plans.

2 - Clearance for reinforcing bars shall be as follows, unless otherwise noted:

a - 1½" for stirrups of beams & pier caps.
b - 2" for ties of columns.
c - 2" for formed walls.
d - 3" for footings.

3 - Concrete seats receiving steel plates, lead plates or neoprene pads shall be poured monolithically with supporting structures & top surfaces of the concrete seats shall be finished with a steel trowel to a smooth level at the elevation shown on the plans.

4 - Reinforcing shall be detailed in accordance with A.C.I. Manual of Standard Practice for Detailing Reinforced Concrete Highway Structures unless otherwise noted.

5 - Reinforcing bars shall be securely tied at all intersections & lap splices & shall be held in place during pouring to maintain their proper locations as shown on plans.

6 - Splicing of reinforcing shall be done as shown in above sketch except where shown otherwise. Splices are to be staggered. Splices in main bridge bars are permitted only in bars exceeding 60'-0" in length at points indicated by the Engineer. Splices to be electrically welded shall be according to detail & specifications. No allowance will be made in the quantities for extra weight of steel required for splices not shown on the plans.

Minimum spacing between parallel bars shall be 1½ times the diameter of bars, but in no case shall the clear distance between the bars be less than 1½ times the maximum size of the coarse aggregate.

All dimensions relating to reinforcing are to centers of bars unless otherwise noted.

7 - Forms for all exposed surfaces of separation structures including retaining walls (except round columns) shall be plywood. Forms for round columns shall be made of material that results in smooth finishes & true dimensions as shown on the plans. Forms for prestressed concrete members shall be either metal or plywood.

8 - Concrete finish - See Special Provisions.

9 - All welding shall conform to the latest Specifications for Welded Highway & Railway Bridges of the American Welding Society.

10 - Vertical column bars shall be arranged in such a manner as to miss pier cap bars above as directed by the Engineer.

11 - Except as otherwise noted on drawings all exterior corners & re-entrant angles in concrete work shall be chamfered ¾" x ¾". See Standard Specifications.

NOTE:
Carbon content of reinforcing bars for welding shall not be over 0.40%. Low hydrogen electrodes E7015 or E7016 shall be used with preheat and interpass temperature not less than 200°F.
