

Chapter 3

Sediment Control

Sediment Control (SC) BMPs are controls implemented for a construction site that limit the amount of sediment from being transported and deposited off-site. Sediment Control BMPs serve as treatment measures by providing a second line of defense. Sediment control BMPs are used to detain sediment-laden storm water runoff and promote infiltration and/or sedimentation.

In this chapter:

- Retain sediment on-site;
- Protect storm drain inlets;
- Establish perimeter controls;
- Control dewatering practices.
